## Safety Guidelines

This manual contains information that is important for you, the owner/operator, to know and understand. This information relates to protecting **personal safety** and **preventing equipment problems**. It is the responsibility of the owner/operator to inform anyone operating or working in the area of this equipment of these safety guidelines. To help you recognize this information, we use the symbols that are defined below. Please read the manual and pay attention to these sections. Failure to read this manual and its safety instructions is a misuse of the equipment and may lead to serious injury or death.

**This is the safety alert symbol. It is used to alert you to potential personal injury hazards. Obey all safety messages that follow this symbol to avoid possible injury or death.**

**DANGER** indicates an imminently hazardous situation which, if not avoided, will result in death or serious injury.

**WARNING** indicates a potentially hazardous situation which, if not avoided, could result in death or serious injury.

**CAUTION** indicates a potentially hazardous situation which, if not avoided, may result in minor or moderate injury.

**CAUTION** used without the safety alert symbol indicates a potentially hazardous situation which, if not avoided, may result in property damage.

**NOTE** indicates information about the equipment that you should pay special attention.

## 1. Safety

### Dryer Operation

Thank you for choosing a GSI product. It is designed to give excellent performance and service for many years.

This manual describes the operation for all standard production model dryers. These dryers are available with liquid propane or natural gas fuel supply and 3 phase 230, 380, 460 or 575 volts (50 Hz or 60 Hz) electrical power.

Our foremost concern is your safety and the safety of others associated with this equipment. We want to keep you as a customer. This manual is to help you understand safe operating procedures and some problems which may be encountered by the operator and other personnel.

As owner and/or operator, it is your responsibility to know what requirements, hazards and precautions exist, and to inform all personnel associated with the equipment or in the area. Safety precautions may be required from the personnel. Avoid any alterations to the equipment. Such alterations may produce a very dangerous situation where SERIOUS INJURY or DEATH may occur.

This equipment shall be installed in accordance with the current installation codes and applicable regulations which should be carefully followed in all cases. Authorities having jurisdiction should be consulted before installations are made.

### Emergency Stop Switch

The Emergency Stop switch is located on the upper control box door. Pushing the Emergency Stop switch will interrupt the control power and stop all dryer functions.

***Pushing the Emergency Stop switch does not interrupt the main power to the upper control box panel.***

## Operating Precautions

### READ THESE INSTRUCTIONS BEFORE INSTALLATION AND OPERATION SAVE FOR FUTURE REFERENCE

1. Read and understand the operations manual before attempting to operate the unit.
2. Keep ALL guards, safety decals and safety devices in place. **NEVER** operate dryer while guards are removed.
3. Keep visitors, children and untrained personnel away from dryer at all times.
4. Never attempt to operate the dryer by jumping or otherwise bypassing any safety devices on the unit.
5. Always set the main power supply disconnect switch to OFF and lock it in the OFF position using a padlock before performing any service or maintenance work on the dryer or the auxiliary conveyor equipment.
6. Keep the dryer and wet holding equipment CLEAN. **DO NOT** allow fine material to accumulate.
7. On LP fired units, set pressure regulator to avoid excessive gas pressure applied to a burner during ignition and when the burner is in operation. Do not exceed maximum recommended drying temperatures.
8. **DO NOT** operate the dryer if any gas leak is detected. Shut down and repair before further operation.
9. Clean grain is safer and easier to dry. Fine materials can be highly combustible, and it also requires removal of extra moisture.
10. Use **CAUTION** in working around high-speed fans, gas burner, augers and auxiliary conveyors which can **START AUTOMATICALLY**.
11. Be certain that capacities of auxiliary conveyors are matched to dryer metering capacities.
12. **DO NOT** operate in an area where combustible material will be drawn into the dryer.
13. The operating and safety recommendations in this manual pertain to the common cereal grains as indicated. When drying any other grain or products, consult the factory for additional recommendations.
14. Routinely check for any developing gas plumbing leaks.
15. Before attempting to remove and reinstall the fan blade, contact GSI for the recommended procedure.

### Use Caution in the Operation of this Equipment

This dryer is designed and manufactured with operator safety in mind. However, the very nature of a grain dryer having a gas burner, high voltage electrical equipment and high speed rotating parts, presents hazards to personnel which cannot be completely safeguarded against without interfering with the efficient operation of the dryer and reasonable access to its components.

Use extreme caution in working around high speed fans, gas-fired heaters, augers and auxiliary conveyors, which may start without warning when the dryer is operating on automatic control.

***Keep the dryer clean. Do not allow fine material to accumulate in the plenum chamber or surrounding the outside of the dryer.***

Continued safe, dependable operation of automatic equipment depends, to a great degree, upon the owner. For a safe and dependable drying system, follow the recommendations within the Owner's Manual and make it a practice to regularly inspect the unit for any developing problems or unsafe conditions.

Take special note of the [Operating Precautions](#) before attempting to operate the dryer.

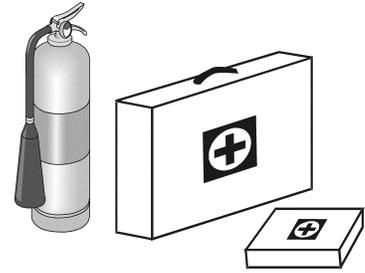

# 1. Safety

## Prepare for Emergencies

Be prepared if fire starts.

Keep a first aid kit and fire extinguisher handy.

Keep emergency numbers for doctors, ambulance service, hospital and fire department near your telephone.

**Keep Emergency Equipment Quickly Accessible**

## Wear Protective Clothing

Wear close fitting clothing and safety equipment appropriate to the job.

Remove all jewelry.

Long hair should be tied up and back.

Safety glasses should be worn at all times to protect eyes from debris.

Wear gloves to protect your hands from sharp edges on plastic or steel parts.

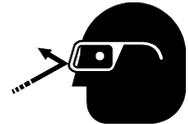

Wear steel toe boots to help protect your feet from falling debris. Tuck in any loose or dangling shoe strings.

A respirator may be needed to prevent breathing potentially toxic fumes and dust.

Wear hard hat to help protect your head.

Wear appropriate fall protection equipment when working at elevations greater than six feet (6').

**Eye Protection**

**Gloves**

**Steel Toe Boots**

**Respirator**

**Hard Hat**

**Fall Protection**

Contact the local power company to have a representative survey the installation to assure the wiring is compatible with their system and adequate power is supplied to the unit. Safety decals should be read and understood by all people in the grain handling area. **Inspect all decals and replace any that are illegible, worn or missing. Contact your dealer or the factory to order replacement decals.**

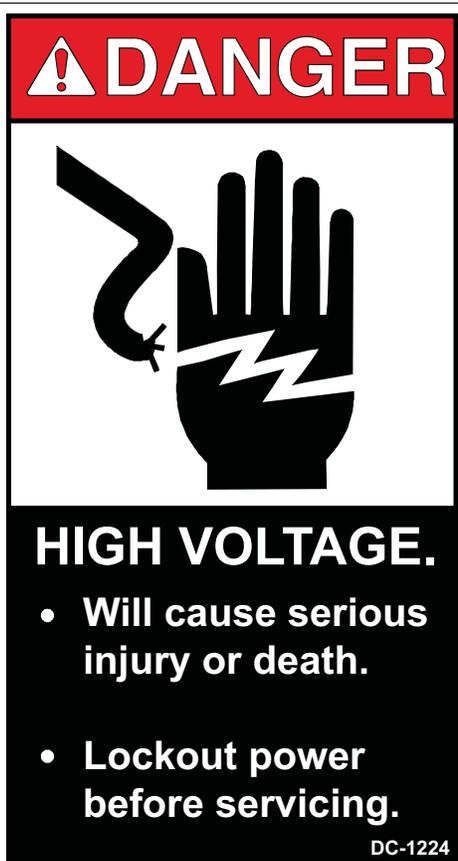

If a decal is damaged or is missing, contact:

**GSI Decals**

1004 E. Illinois St.  
Assumption, IL. 62510  
Phone: 1-217-226-4421

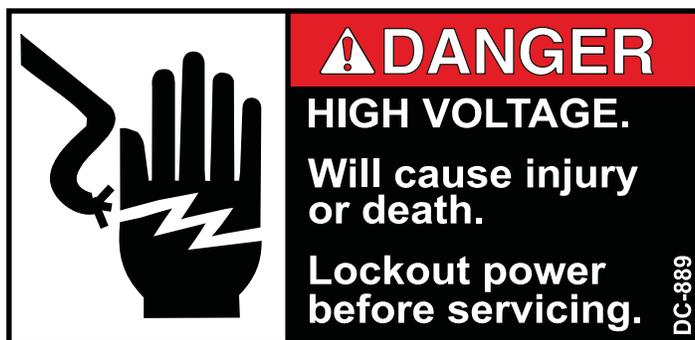

A free replacement will be sent to you.

**NOTE:** *Decals are not shown actual size.*

**Decal: DC-1224**

Decal DC-1224 is located in two places on the fan/heater control box. One on the lid and one on the front of the fan heater control box. Another location for this decal is inside the upper control box for the dryer.

**Decal: DC-889**

Decal DC-889 has two locations. One inside the fan/heater control box and another on the dryer upper control box door next to the main power disconnect.

## 2. Decals

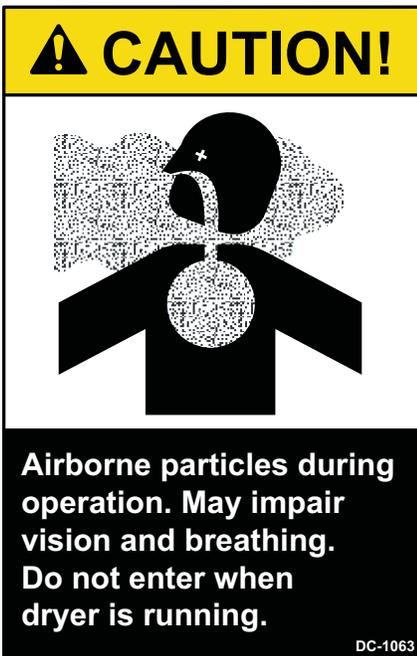

Decal: DC-1061

Decal DC-1061 is located on the outside of the heat section door.

Decal: DC-1062

Decal DC-1062 is located inside the cooling section of the dryer on the two access doors to the metering section.

Decal: DC-1063

Decal DC-1063 is located on the louvered access door to the cooling section of the dryer.

Decal: DC-1064

Decal DC-1064 is located on the louvered access door to the cooling section of the dryer.

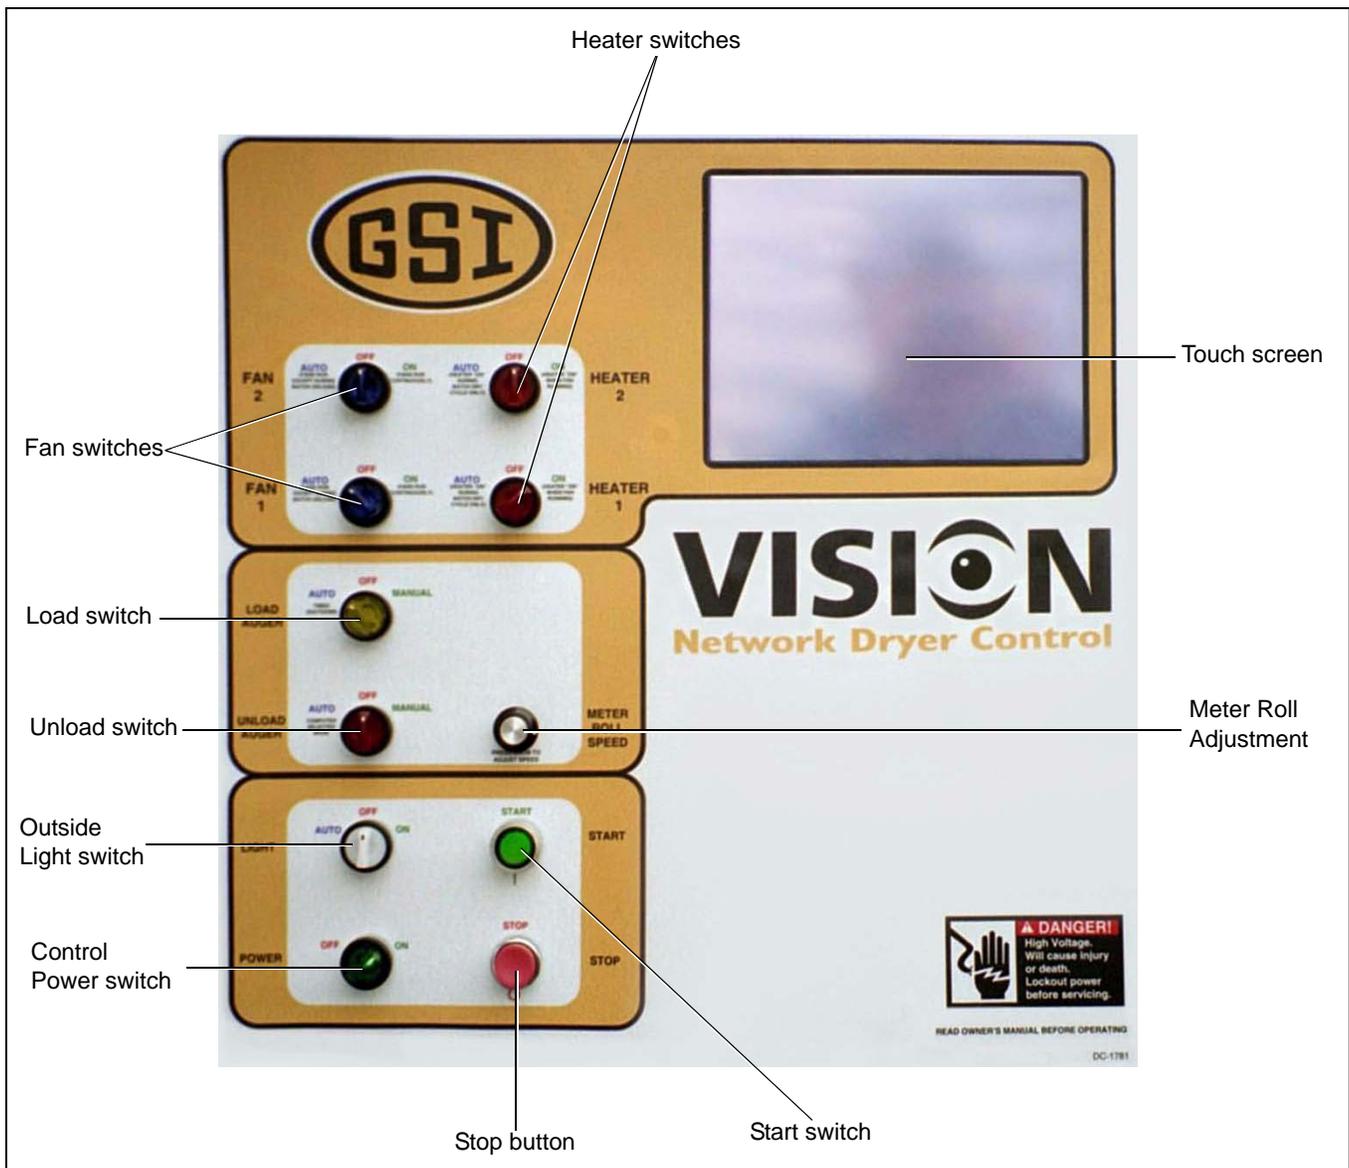

Figure 3A

## Control Power Switch

The Vision control system is turned ON or OFF with this switch.

**NOTE:** This switch does not disconnect the power that is present at the breakers, contactors, transformer(s), fuses or other electrical components found in the control or power box. Turn the main disconnect handle to the OFF position prior to servicing any of the installed components.

## Stop Button

This button stops all dryer functions except the blower (fan). If the blower switch, noted on the panel as the Fan switch, is in the ON position, the blower will continue to run for 15 minutes. If you desire the blower to be OFF, turn the blower switch to the OFF position. If an automatic dryer shutdown occurs, first determine and correct the cause of the shutdown. Then, press the Stop button to reset the dryer before restarting.

### 3. Vision Control Panel

## Outside Light Switch

The dryers outside service light is turned ON or OFF here. It also can be set on AUTO, which turns the light ON while the dryer is running and OFF if a shutdown occurs.

## Start Button

Push the Start button and all of the selector switches on the control panel will be activated.

## Unload Switch

The Unload switch turns the metering rolls and discharge auger ON or OFF and selects the operation of the metering rolls. In the MANUAL position, the meter rolls will operate in one Speed only. In the AUTO position, the meter rolls switch to a multi-speed mode for moisture control operation. The switch will illuminate whenever the load auger is operating.

**NOTE:** *If the unload auxiliary controls are being used, this switch will also control the operation of the auxiliary equipment.*

## Meter Roll Adjustment

This knob allows the user to adjust the meter roll setpoint(s). Pressing the knob will bring up the “Modifying Meter Roll Speed Setpoints” screen. (See Figure 3B.)

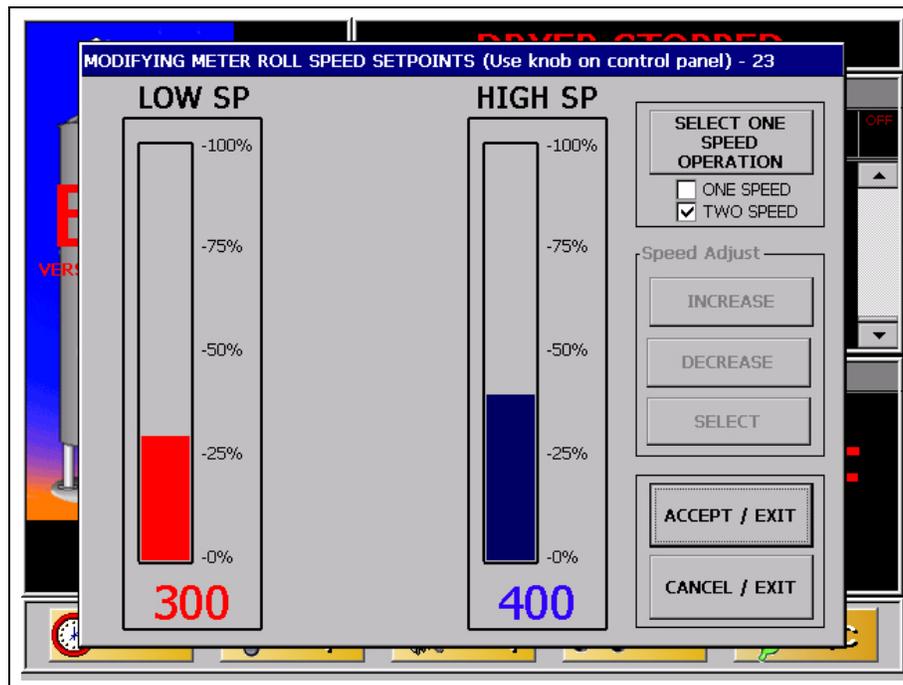

Figure 3B

**NOTE:** *Screen may vary depending on the moisture control scheme selected.*

Turning the knob clockwise will adjust the selected (red color) setpoint in a positive direction and vice versa. Pressing the knob will switch between setpoints.

### Load Switch

This is used to select the operation of the fill auger. In both the AUTO and MANUAL positions, the load auger will operate if the dryer is low on grain and will automatically shut OFF when the dryer is full. In the AUTO position, the dryer will shutdown if the out of grain timer expires. The load delay is disabled when the Load switch is in the MANUAL position. The switch will illuminate whenever the load auger is operating.

### Fan Switch

The fan is turned ON or OFF with this switch. Turning the switch to the ON position will turn the fan ON. Turning the switch to the OFF position turns the fan OFF. The light inside the switch will illuminate whenever the air pressure sensor detects air movement through the fan.

**NOTE:** *The fan AUTO position is not used for continuous flow operation.*

### Heater Switch

The burner (heater) is turned ON or OFF with this switch. Turning the switch to the ON position will start the burner ignition sequence if the fan is also running. Turning the switch to the OFF position turns the burner OFF. The light inside of the switch will illuminate only when the flame sensor detects the burner flame.

**NOTE:** *The heater AUTO position is not used for continuous flow operation.*

## 4. Boot Screen

### Boot Screen Description and Button Explanations

Turning the Control Power switch to the ON position, will start the Vision computer. The first screen to appear will be the Boot Screen. Notice that there are four (4) buttons on the Boot Screen. (See Figure 4A.)

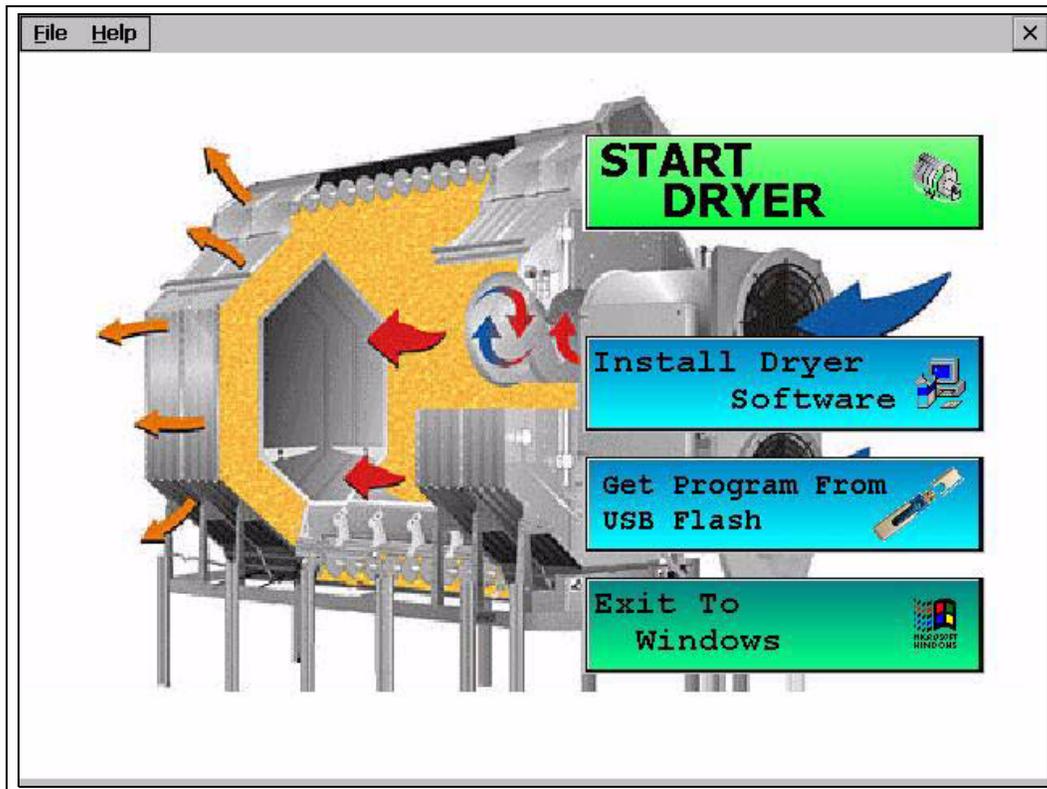

Figure 4A

1. **Start Dryer:** This button accesses the dryer program.
2. **Install Dryer Software:** This button is used in updating the Vision software, which is described further in this chapter.
3. **Get Program From USB Flash:** This button is used in updating the Vision software, which is described further in this chapter.
4. **Exit To Windows:** This button should NOT be used in normal operation. Only the GSI Group employees should press this button. Turn the Control Power switch OFF, then ON if this button is inadvertently pushed to return to the regular Boot Screen.

## Software Update Procedure

1. Cycle the Control Power switch. The Vision computer will start. (See Figure 4B.)

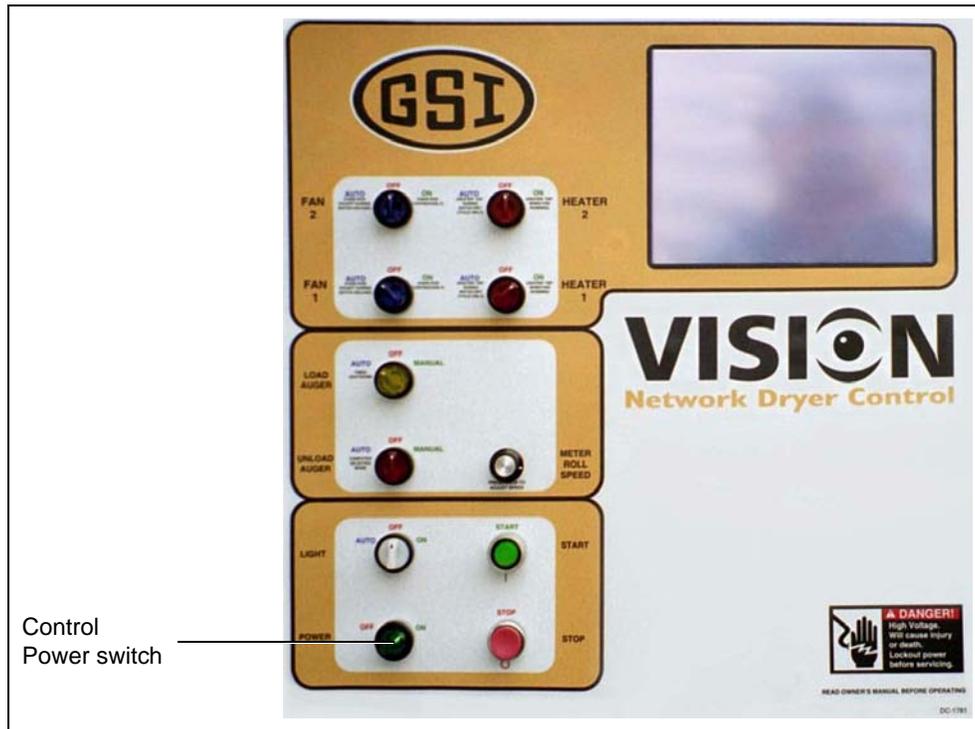

Figure 4B

2. When the “Boot Screen” appears, touch the “Get Program From USB Flash” button. (See Figure 4C.)

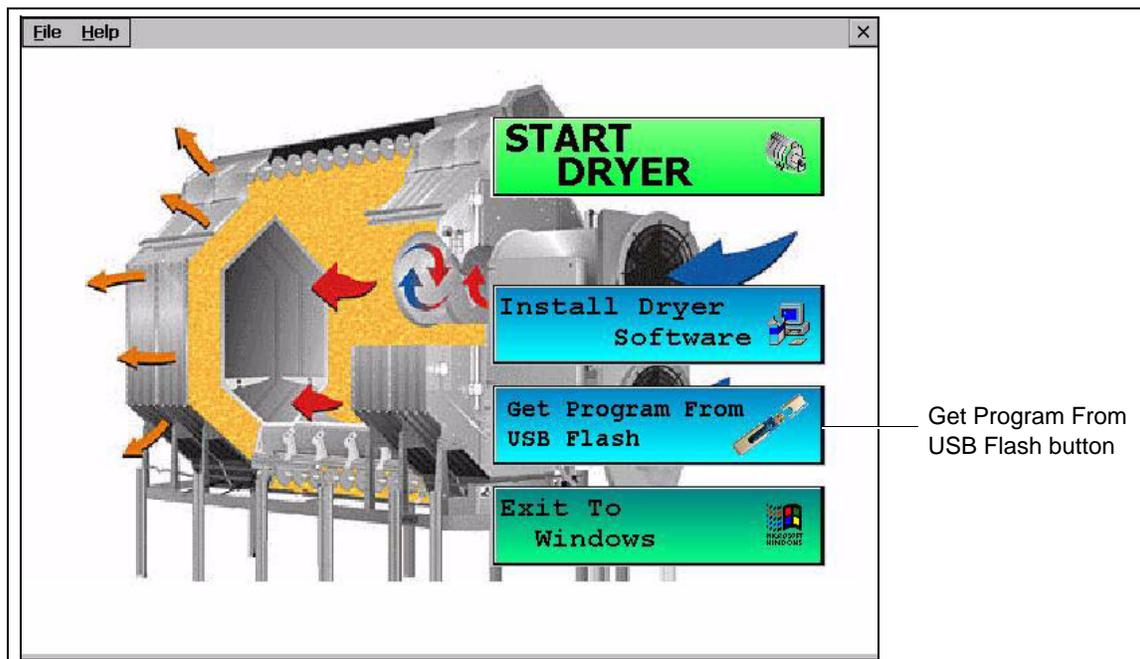

Figure 4C

## 4. Boot Screen

3. Insert USB flash drive into USB port.
4. The display will now confirm that program files were found.

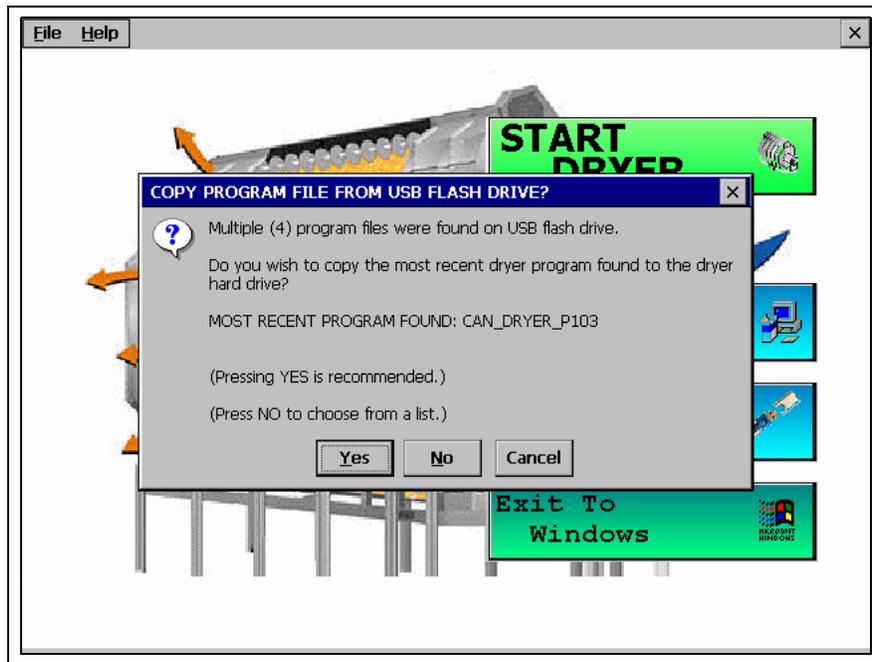

Figure 4D

Press “Yes” to copy.

5. After the program files are transferred, the “Boot Loader” screen will appear. (See Figure 4E.)

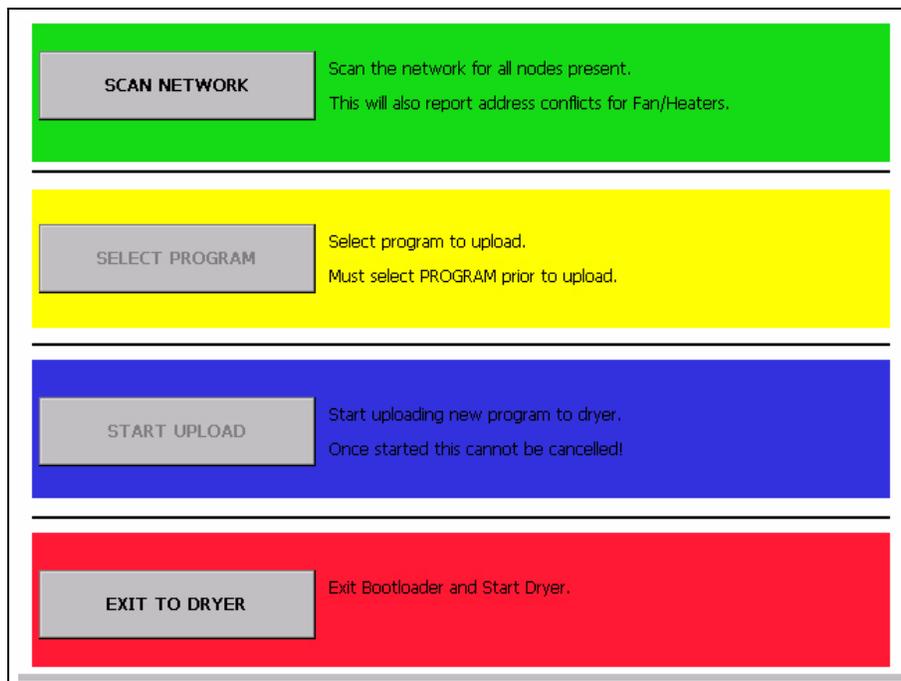

Figure 4E

Select the “Scan Network” button. This scan will check the dryer to make sure all parts of the control system are communicating directly.

- After the scan is complete, the Display I/O, Main I/O, Moisture Control and the Fan/Heater(s) should be shown as “Nothing to Report”. (See Figure 4F.)

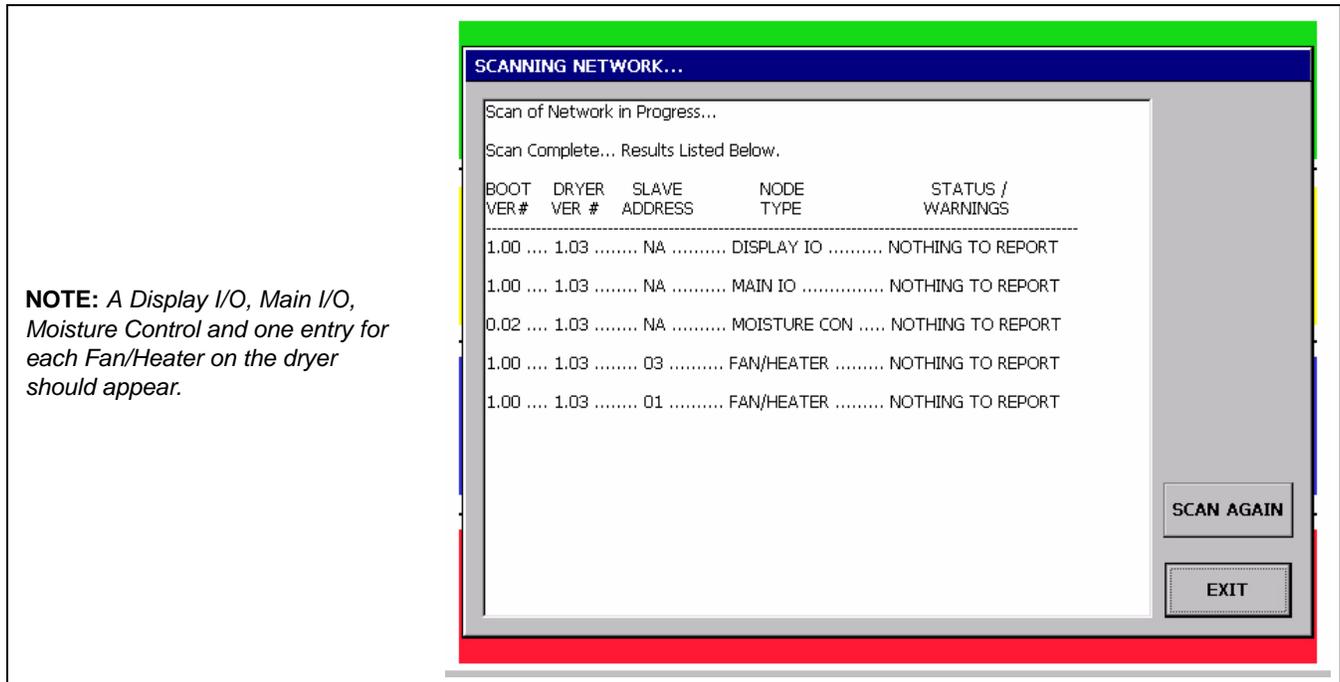

Figure 4F

Touch the “Exit” button.

- Choose the “Select Program” button from the “Boot Loader” screen. (See Figure 4G.)

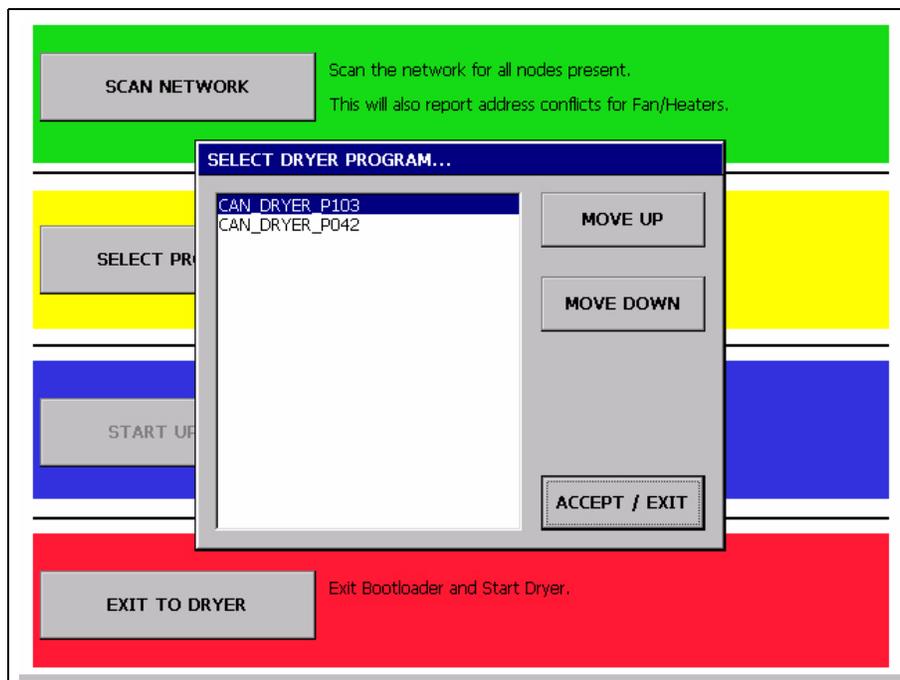

Figure 4G

## 4. Boot Screen

8. Select the program file you wish to upload by touching the “Move Up” and “Move Down” buttons until the desired program file is highlighted. Then, choose the “Accept/Exit” button.
9. Touch the “Start Upload” button.
10. When the “Upload Progress” screen appears, select the “Start Upload” button. (See Figure 4H.)

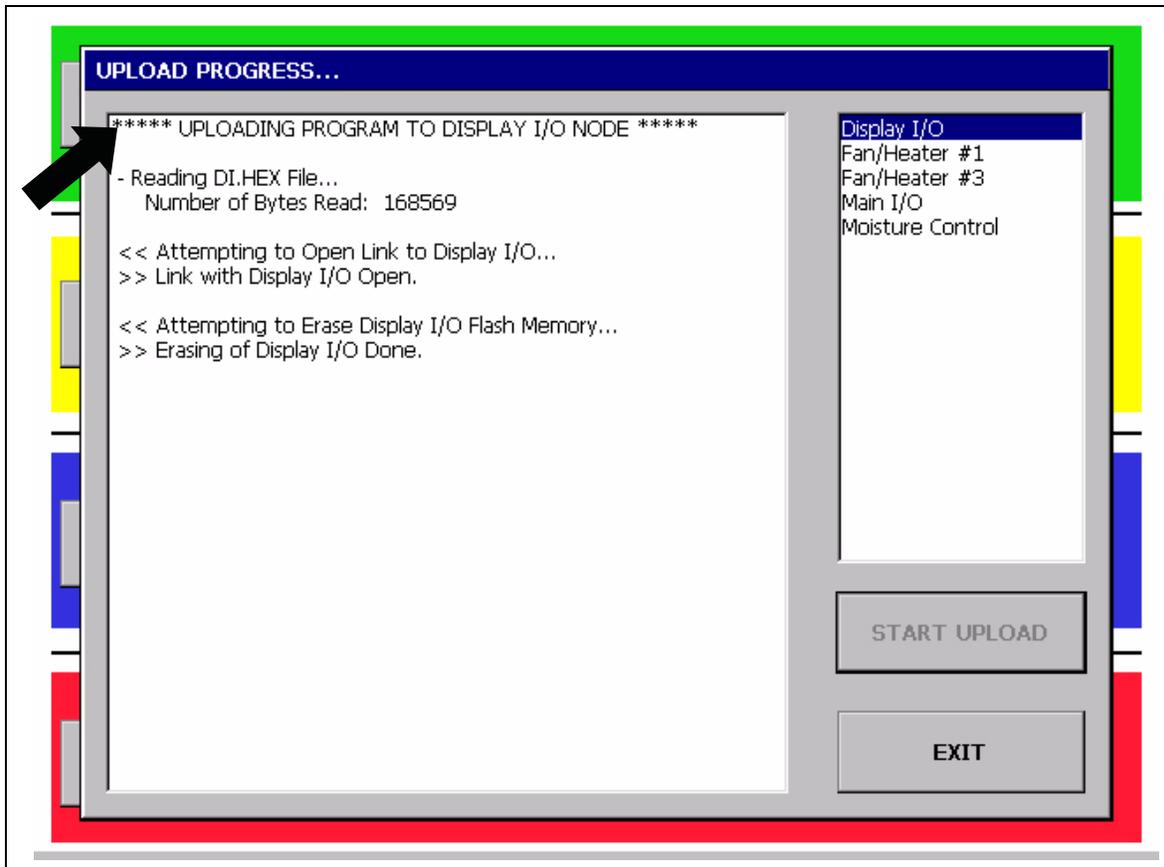

Figure 4H

11. The Vision computer will now begin programming each of the network circuit boards on the dryer. The box on the right of the screen lists the network circuit boards detected in the scan. Each circuit board listed will have to be reprogrammed, so this may take a few minutes. File upload progress for the circuit board that is highlighted is displayed in the box on the left. (See Figure 4H.)
12. Once the upload is complete, choose the “Exit to Dryer” button to leave the “Boot Loader” screen and start the dryer.
13. The dryer will begin running the program that was just installed.
14. The dryer control is now ready to operate the dryer.
15. In the event it is determined that reversion to the previous software version is necessary, go back to the Boot Screen and select “Install Dryer Software” and follow the instructions above to re-install the previous software.

# Operations

## Default Operation Screen

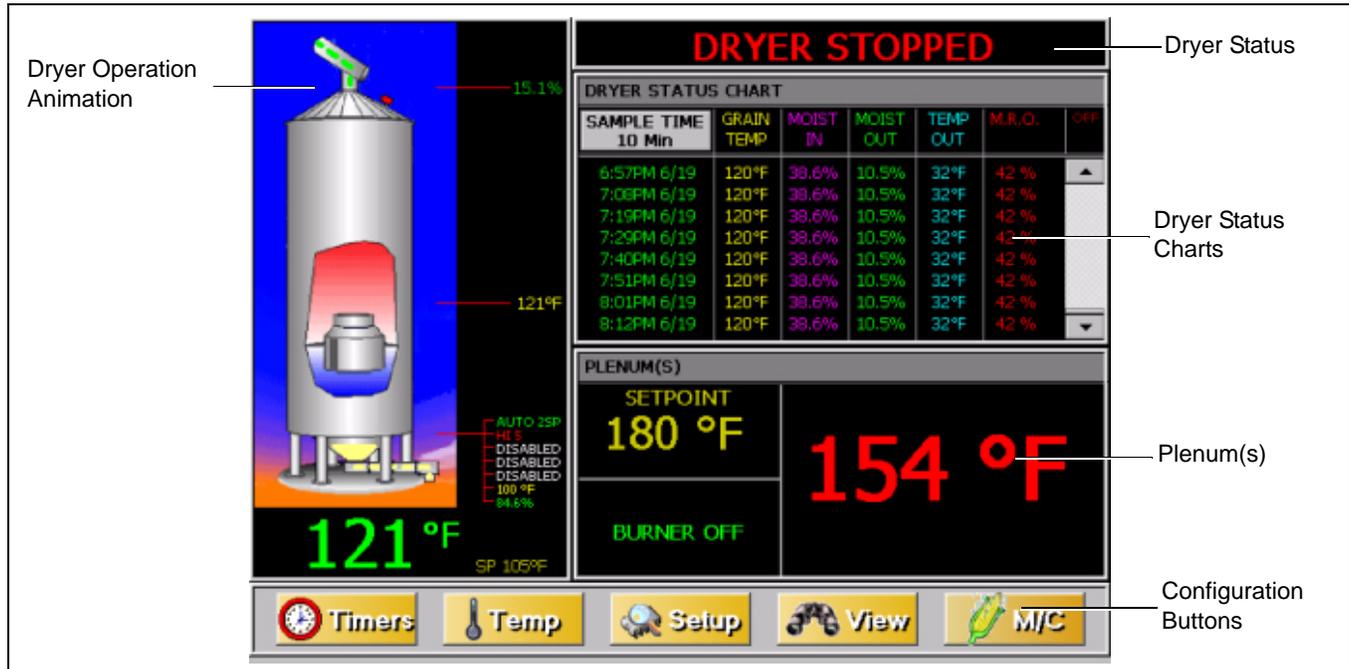

Figure 5A

The “Default Operation Screen” is divided into five (5) sections. (See Figure 5A.)

- Dryer Operation Animation:** Located on the left side of the “Default Operation Screen”, the dryer operation animation shows the status of the fans/heaters, load and unload augers and meter rolls. It will also display the grain temperature, moisture content, moisture control setpoint and the bushel counter.
- Dryer Status:** Located at the very top of the right side of the “Default Operation Screen”, the dryer status will tell the user if the dryer is stopped, started, loading or unloading.
- Dryer Status Chart:** This chart, located directly under dryer status, will show the grain temperature, moisture in/out, temperature out and meter roll output (M.R.O) over a period of time.
- Plenum(s):** Located directly below dryer status chart, the plenum section will show temperature setpoint, actual plenum temperature and burner status.
- Configuration Buttons:** Select from “Timers”, “Temp”, “Setup”, “View” and “M/C” buttons.

### Timers Button

Select the  Timers button. A new screen will appear called the “Select Timer to Modify” screen. (See [Figure 5B](#).) There are five (5) timers that can be modified.

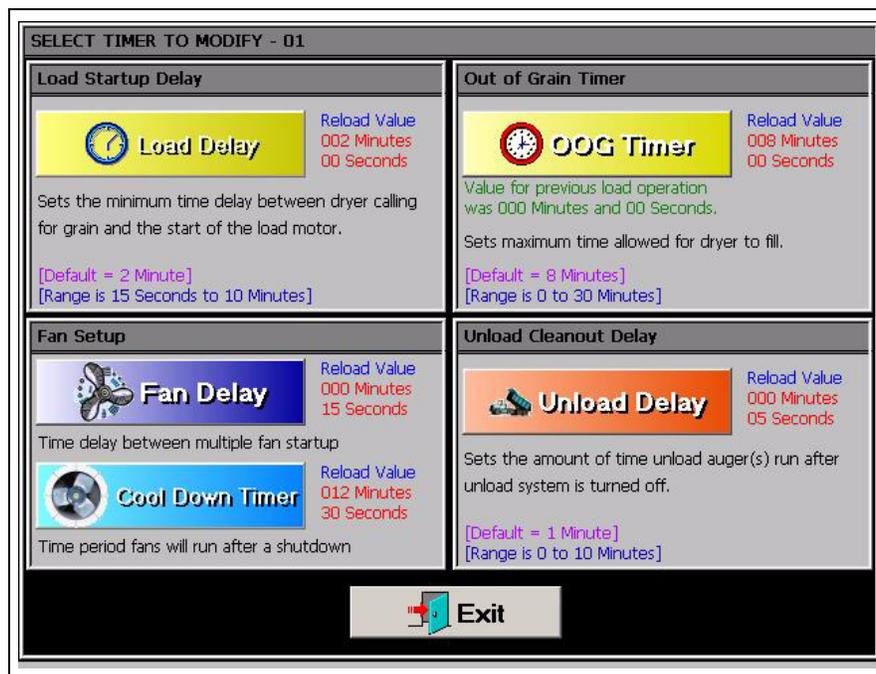

Figure 5B

1. **Load Delay:** (Default setting - 2 minutes) This delay is used to prevent the load auger from over-cycling. The load delay is active only when the Load switch is in the AUTO position. The timer starts when the dryer calls for grain.
2. **Out Of Grain (OOG) Timer:** (Default setting - 8 minutes) The “OOG” timer should be set to the maximum time it takes for the dryer to refill during continuous or batch drying modes. The computer will display the time required to fill the dryer on the previous load, aiding you in setting an accurate time. If the dryer runs out of grain while the Load switch is in the AUTO position, the “OOG” timer automatically shuts off the dryer after the period of time preset on the timer.
3. **Fan Delay:** (Default setting - 3 seconds) The “Fan Delay” timer controls the amount of time between each fan startup to reduce the dryer inrush amperage.
4. **Unload Delay:** (Default setting - 1 minute) The “Unload Delay” timer is used to regulate the amount of time the unload auger runs after the metering rolls stop.
5. **Cool Down:** (Default setting - zero minutes) The dryer fans will operate for a “Cool Down” period in the event that the dryer experiences a shutdown, other than that of a plenum, grain high temperature or fan motor overload situation. The dryer can also be restarted by pressing the “Start” button on the front of the Vision control panel. This prevents the fans from shutting down because of nuisance warnings.

To change a timer setpoint, touch the button of the timer you wish to modify. The “Modifying Timer Setpoint” screen will then be displayed, which is shown in [Figure 5C on Page 21](#). The left number pad is used to modify the minutes and the right number pad will modify the seconds. Touching the “Default” button will automatically set the timer to the default setpoint for that timer. The “Accept” button will save the displayed time as the setpoint. Choosing “Cancel” will exit the “Modifying Timer Setpoint” screen without saving any changes and the timer will stay at the currently saved setpoint.

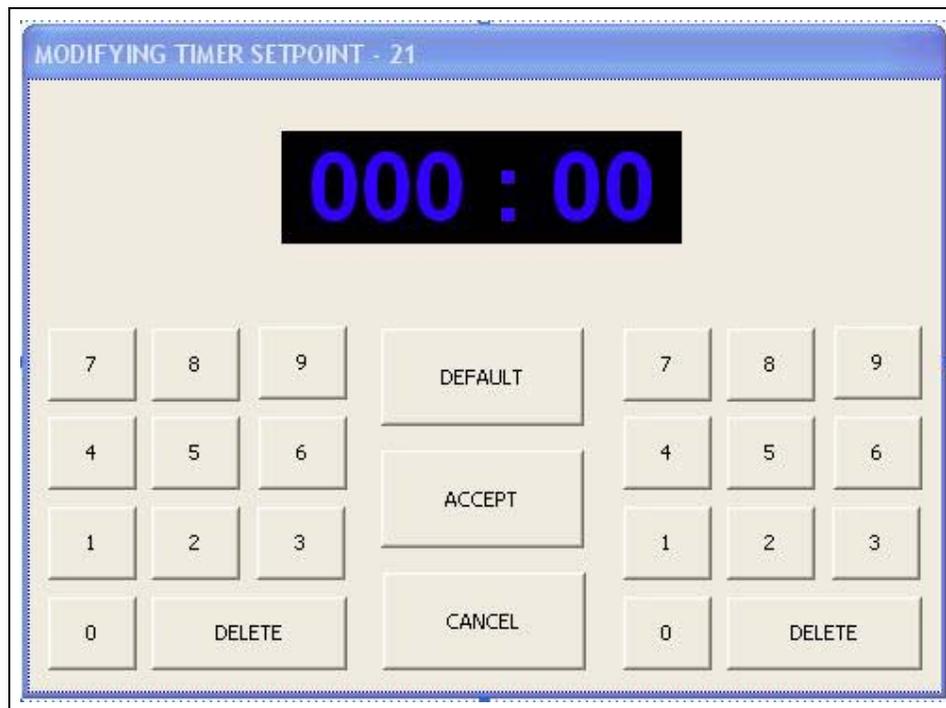

Figure 5C

## Temp Button

To adjust the temperature setpoints, touch the  **Temp** button at the bottom of the “Default Operation Screen”. A new screen will appear called the “Select Temperature Setpoint to Modify” screen. (See Figure 5D.)

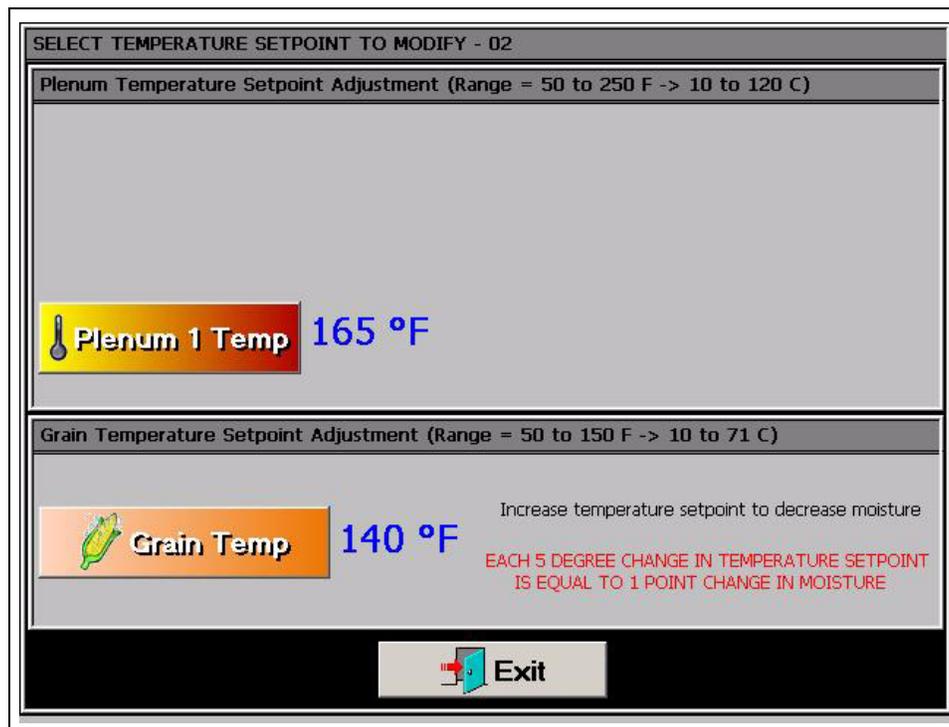

Figure 5D

## 5. Operations

Modify the setpoint for each of the temperatures by selecting the corresponding button.

**Plenum Temperature Setpoint** - Press the “Plenum X Temp” button to change the individual plenum setpoints. The “X” refers to a number between 1 and 6. Plenum #1 refers to the heater closest to the ground.

**Grain Temperature Setpoint** - This setpoint is used for all temperature based moisture control schemes. For more information, see the [Moisture Control Options Chapter on Page 35](#).

The plenum temperature setpoint range is 50 F-250 F. The current temperature setpoint is displayed next to the corresponding “Plenum” button.

The grain temperature setpoint range is 50 F-160 F. The current temperature setpoint is displayed next to the “Grain Temperature” button.

Touch the desired plenum button of the setpoint you wish to change. The “Modifying Temperature Setpoint” screen will appear. (See [Figure 5E](#).)

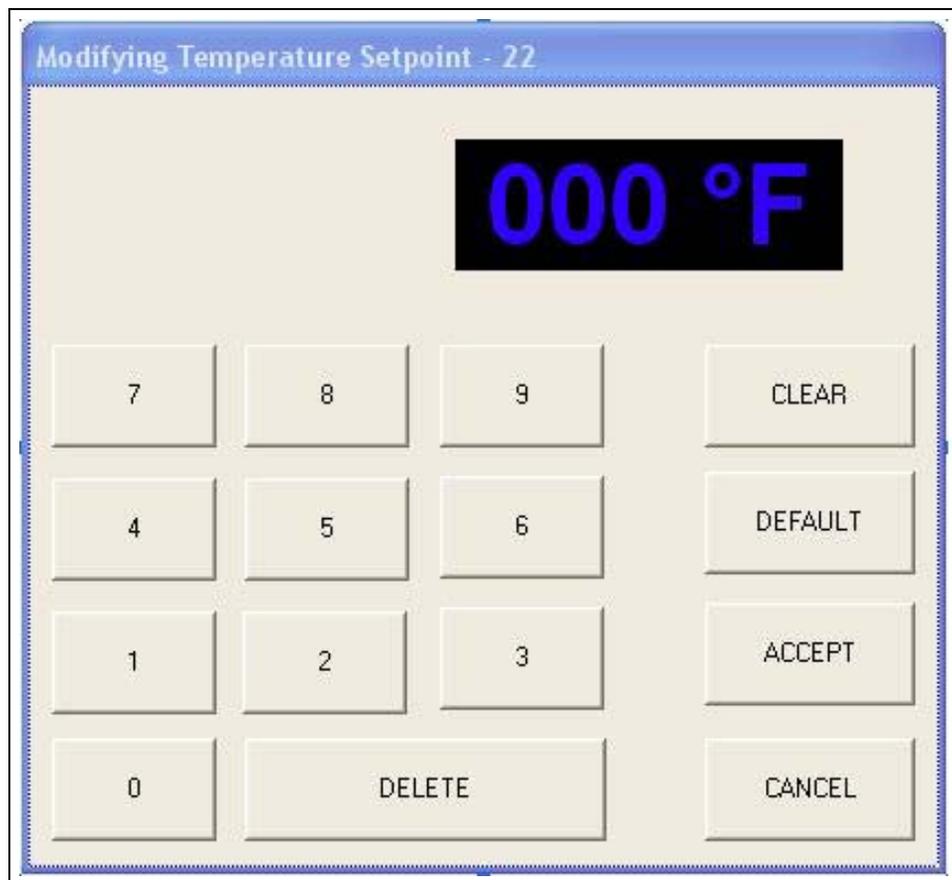

Figure 5E

Enter the desired temperature using the displayed number pad, then touch the “Accept” button. Touching the “Cancel” button will return you to the “Select Temperature Setpoint to Modify” screen without saving changes.

## Setup Button

The Setup screen will allow you to configure other parameters of the dryer. To access the “Select Hardware Setup Parameter to Modify” screen, also known as the “Setup Screen”, touch the  Setup button. (See Figure 5F.)

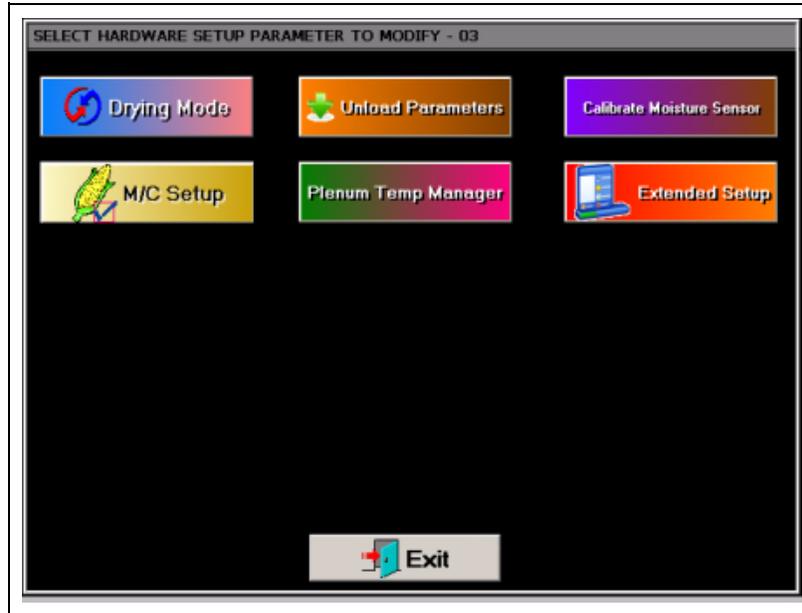

Figure 5F

The following list can be modified:

1. **Drying Mode:** The  button will display the “Drying Mode Selection” window. Select continuous flow. A check mark is displayed next to the currently selected drying mode. (See Figure 5G.)

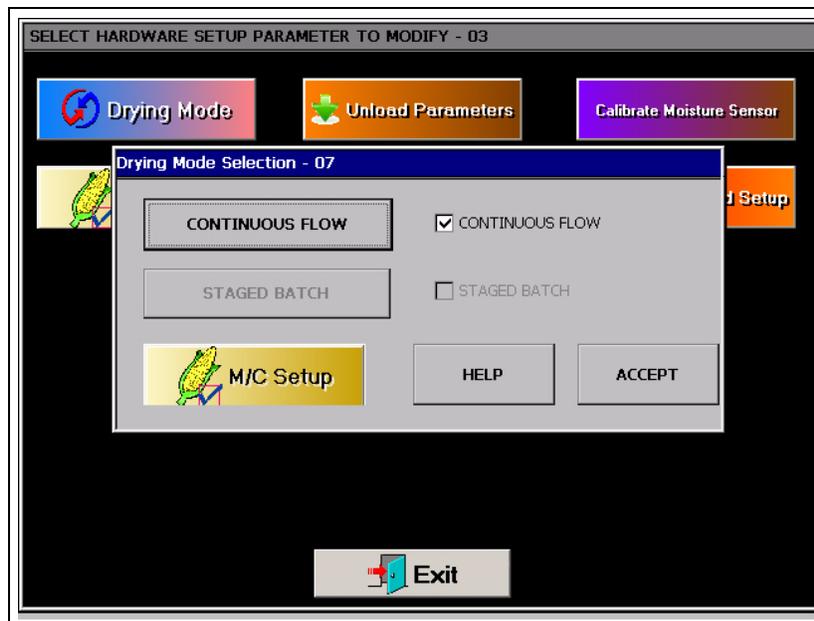

Figure 5G

## 5. Operations

2. **Moisture Control Setup:**  The moisture control setup operations are described in greater detail in the [Moisture Control Options Chapter on Page 35](#).

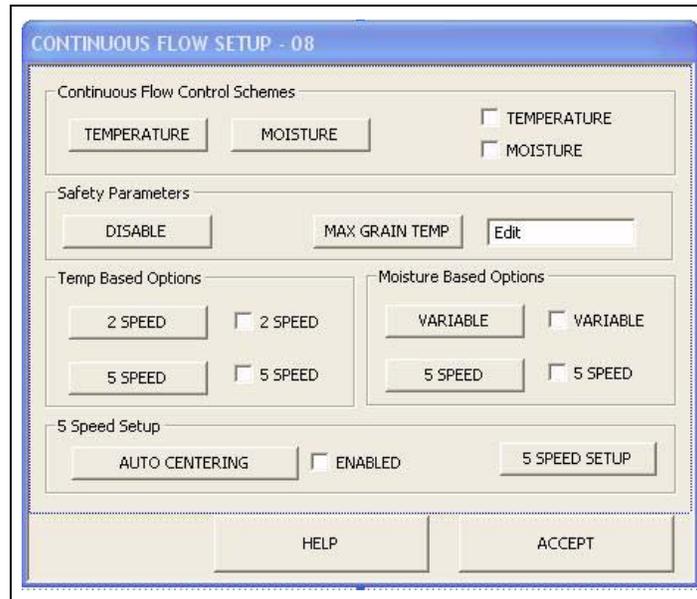

Figure 5H

3. **Unload Parameters:** 

- Set Maximum Unload Rate:** The meter roll speed setpoint cannot be set higher than this value. This prevents choking downstream augers.
- Set Minimum Unload Rate:** The meter roll speed setpoint cannot be set lower than this value. (See [Figure 5I](#).)

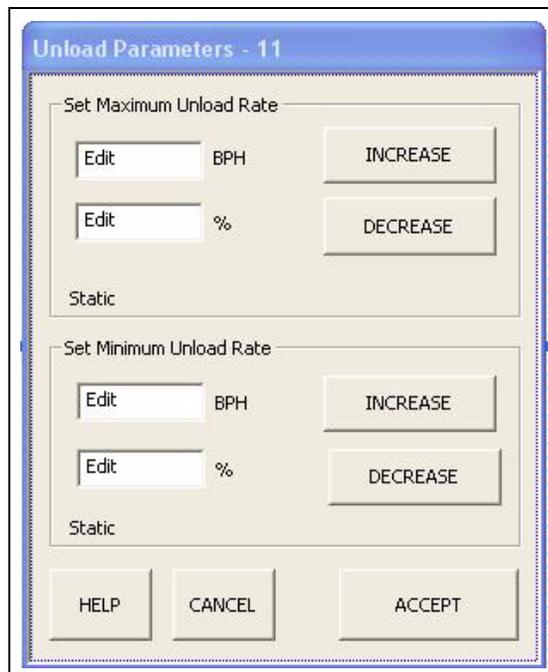

Figure 5I

4. **Plenum Temp Manager:** Plenum Temp Manager This will reduce the plenum temperature setpoint(s) if the unload rate reaches its maximum allowable value for the time specified by the “Time Between Steps” menu. Once the time has been exceeded, the dryer will reduce the temperature setpoint(s) by the value given in the “Size of Temperature Step”. If the unload rate falls below the maximum allowable value for the “Time Between Steps” period, the temperature setpoint(s) will be increased by the “Size of Temperature Steps” until the original setpoints are met. (See Figure 5J.)

**NOTE:** Default setting is “OFF”.

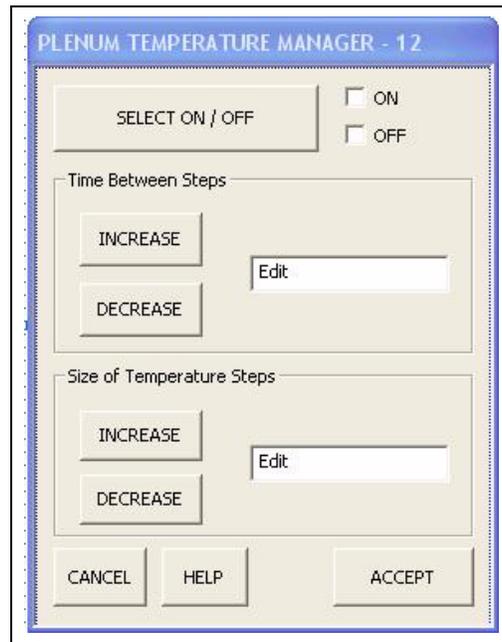

Figure 5J

5. **Calibrate Moisture Sensor:** Calibrate Moisture Sensor There are two (2) moisture/temperature sensors per dryer - one for incoming grain (wet) and another for outgoing (dry). Each device has one moisture and one temperature sensor included. (See Figure 5K.)

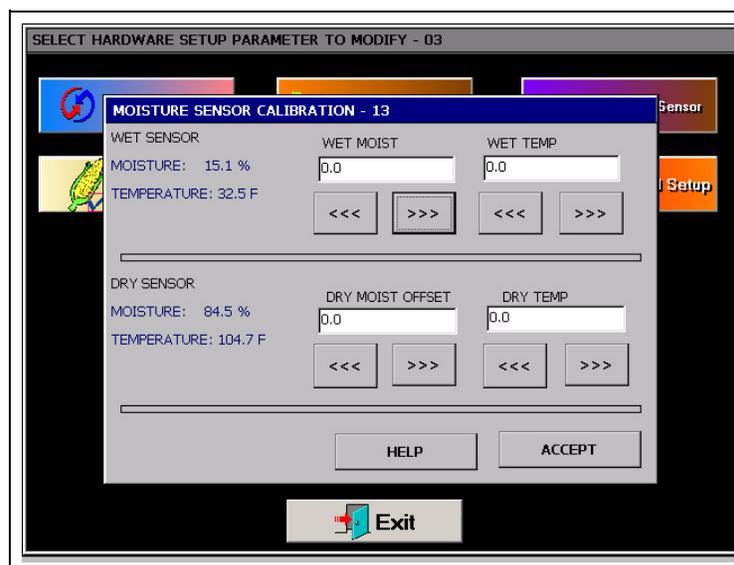

Figure 5K

## 5. Operations

**Calibrating moisture:** Take several moisture samples of the grain over an extended period of time, average these values and calibrate the sensors accordingly.

**Example:** If the dryer's exiting moisture (dry) is reported at 15.5% on the Vision screen and the averaged samples yielded a value of 15%, then the calibration screen would be used to enter -0.5% as the "Dry Moist Offset".

**Calibrating temperature:** Take several temperature samples of the grain over an extended period of time, average these values and calibrate the sensor accordingly.

**Example:** If the dryer's incoming temperature (wet) is reported to be 105°F on the Vision screen and the average samples yield a value of 100°F, adjust the "Dry Temp" to -5.

## 6. Extended Setup Screen

The following list can be modified here:

### 1. Diagnostics: Diagnostics

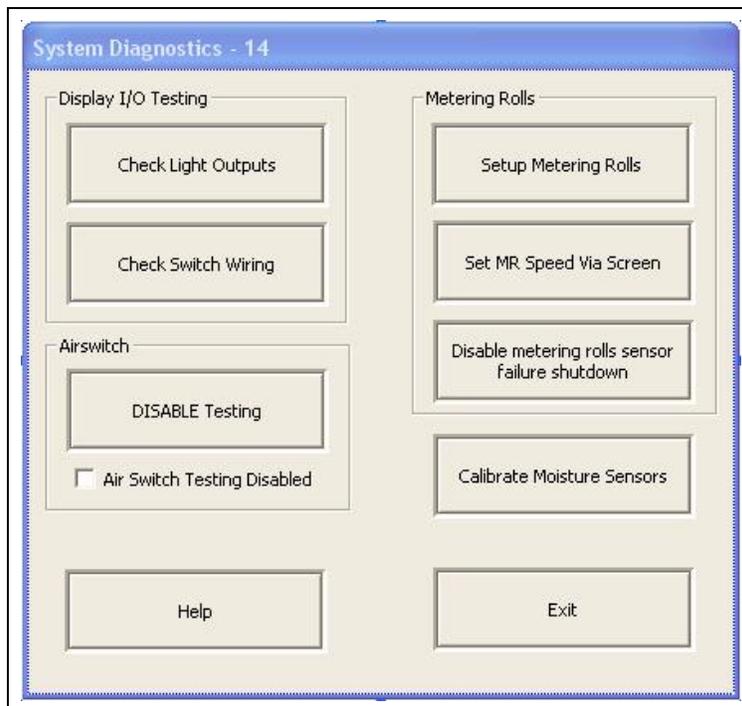

Figure 5L

**Check Light Outputs:** Allow the user to verify the controller is attempting to illuminate each individual switch. If there is a check mark present on the Vision screen, the corresponding switch should be lit. If not, there is a wiring issue.

**Check Switch Wiring:** Allows user to verify the controller is recognizing switch positions correctly. If the "Fan 1" switch is in the "AUTO" position, the "FAN 1 AUTO" box should be checked. If not, there is a wiring issue.

**Setup Metering Rolls:** This option can be used to calibrate the SCR board.

**Set MR Speed Via Screen:** Normally, the meter roll adjustment knob on the control panel is used to set the metering roll setpoint. In the event of a knob malfunction, the metering roll setpoint can be adjusted by this screen.

**Calibrate Moisture Sensors:** Previously mentioned in the preceding "Setup Screen" section [on Page 23](#). This is just another way to access those settings.

2. **Differential:** The  Differential button will display the “Modifying Burner Differential Settings” screen. (See Figure 5M.) Adjusting the burner differential settings allows the operator to keep the plenum temperature within a certain range.

**NOTE:** 1° is the default and preferred setting.

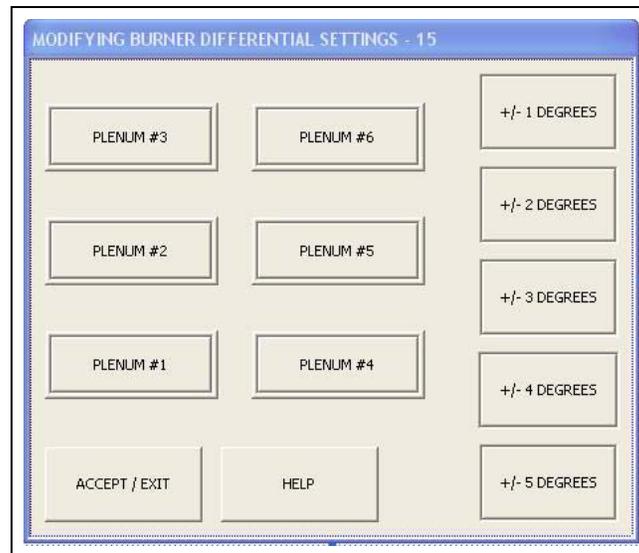

Figure 5M

**Example:** If you have the temperature setpoint at 180°F and you select +/- 3° as the burner differential, then the burner will switch to low heat at 183°F and back to high heat at 177°F.

To modify a burner differential setting, touch the plenum button you wish to modify, then select one of the five (5) differential setting buttons on the right side of the screen. The “Accept/Exit” button will save the settings and return to the “Setup Screen”.

3. **BPH Calibration:** The  BPH Calibration button will display the “Unload Bushels Setup” screen. (See Figure 5N.) The bushel counter can be cleared by touching the “Clear” button. The bushel counter can be calibrated by touching the “Increase” and “Decrease” buttons.

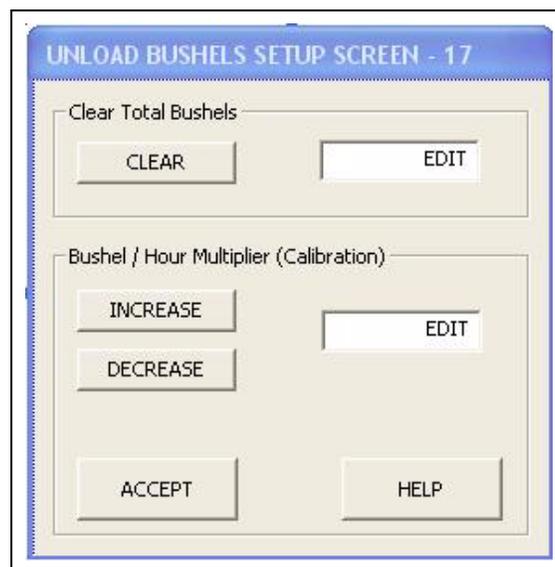

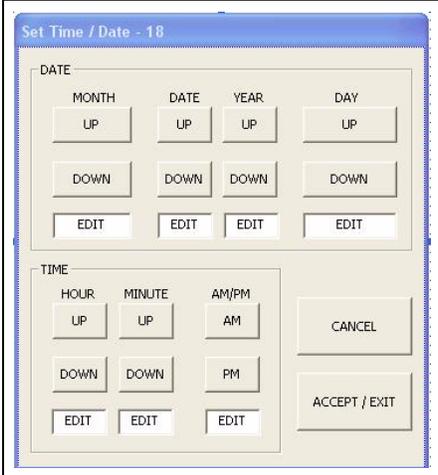

Figure 5N

## 5. Operations

4. **Set Time/Date:** The  button will display the “Set Time/Date” window. (See Figure 50.)

The "Set Time / Date - 18" window is a control panel for setting the date and time. It is divided into two main sections: "DATE" and "TIME".

**DATE Section:**

- MONTH:** UP, DOWN, EDIT buttons.
- DATE:** UP, DOWN, EDIT buttons.
- YEAR:** UP, DOWN, EDIT buttons.
- DAY:** UP, DOWN, EDIT buttons.

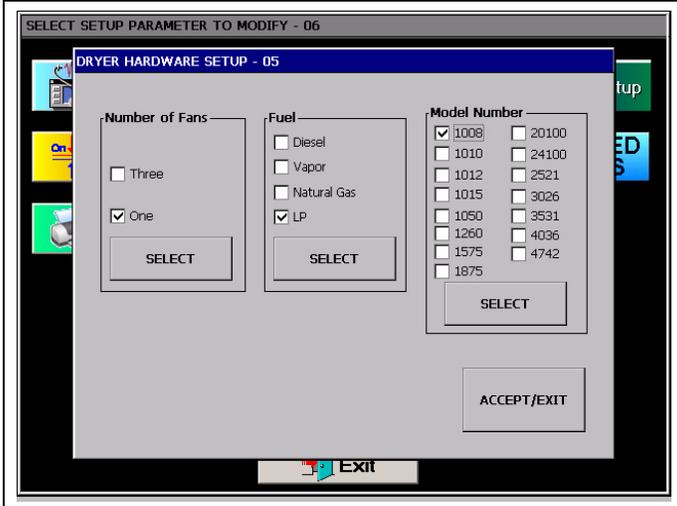

**TIME Section:**

- HOUR:** UP, DOWN, EDIT buttons.
- MINUTE:** UP, DOWN, EDIT buttons.
- AM/PM:** AM, PM buttons.
- Navigation:** CANCEL and ACCEPT / EXIT buttons.

Figure 50

Use the “Up” and “Down” buttons to change each of the parameters. “Accept/Exit” will save settings and return to the “Setup Screen”.

5. **Temp Scale:** The  button allows the user to select either English units or SI units. Depending on what temperature scale you are now operating, this button will display a pop-up window asking if you want to switch to SI (Celsius, metric tons, etc.) or English units (Fahrenheit, bushels, etc.).
6. **Dryer Model:** This  button will display the “Dryer Hardware Setup” window. The following items must be entered correctly:
- Number of Fans
  - Fuel
  - Model Number

The "DRYER HARDWARE SETUP - 05" window is a configuration screen for dryer hardware. It contains three main sections, each with a "SELECT" button:

- Number of Fans:** Radio buttons for "Three" and "One" (selected).
- Fuel:** Radio buttons for "Diesel", "Vapor", "Natural Gas", and "LP" (selected).
- Model Number:** A list of model numbers with checkboxes. "1008" is selected. Other numbers include 20100, 24100, 2521, 3026, 3531, 4036, and 4742.

At the bottom of the window are "ACCEPT/EXIT" and "Exit" buttons.

Figure 5P

To edit these parameters, touch the “Select” button until a check mark appears next to the corresponding detail specific to the dryer model.

7. **Data Logger Setup:** Data Logger Setup By turning the data logger on, it records the following parameters of the dryer every 5 minutes.

- a. Dryer grain temperature
- b. Incoming grain temperature
- c. Incoming grain moisture
- d. Outgoing grain temperature
- e. Outgoing grain moisture
- f. Meter roll speed
- g. Bin number
- h. Hour
- i. Minute

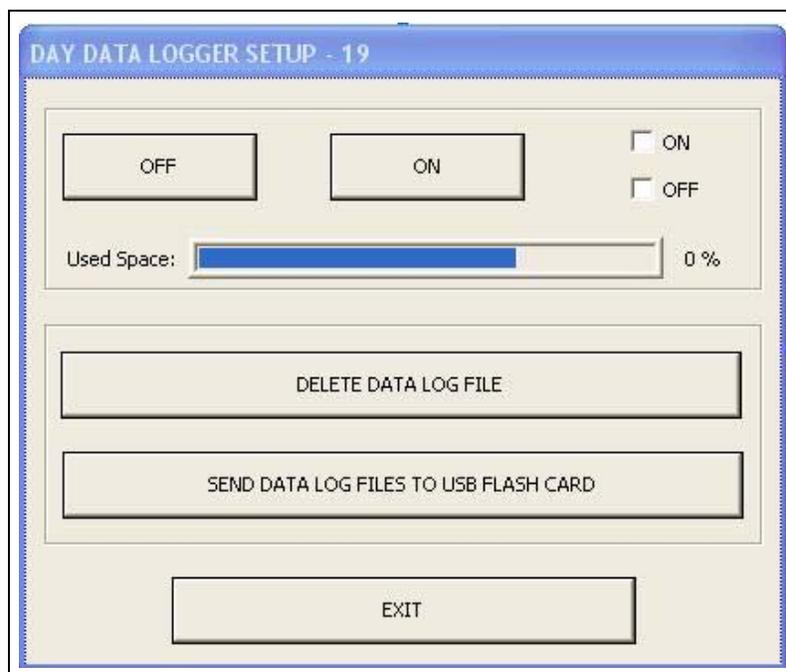

Figure 5Q

### Looking Up Data Logger Records

1. Go to our website ([www.grainsystems.com](http://www.grainsystems.com)) and click on the “GRAIN DRYER VISION CONTROL” link at the right side of the page.
2. Download the “LOGVIEWER INSTALLER” at the top right of the page to the desktop.
3. Execute the “LOGVIEWER SETUP” file and install the program.
4. Open the “Dryer Data Logviewer” program.
5. Navigate the menu to “File” -> “Open”. Select the log file that was downloaded from Vision.
6. Data can be exported to an Excel spreadsheet by “File” -> “Export to spreadsheet file”.

## 5. Operations

8. **User Saved Defaults:** **USER SAVED DEFAULTS** Here, you have the following options:

**Save Settings:** Allows user to store the current setup of the dryer for retrieval later.

**Restore Settings:** Restores the system to the settings last saved by pressing the “Save Settings” button.

### View Button

Choose the  **View** button to open the “View Selection Window”. (See Figure 5R.) The following six (6) options are displayed:

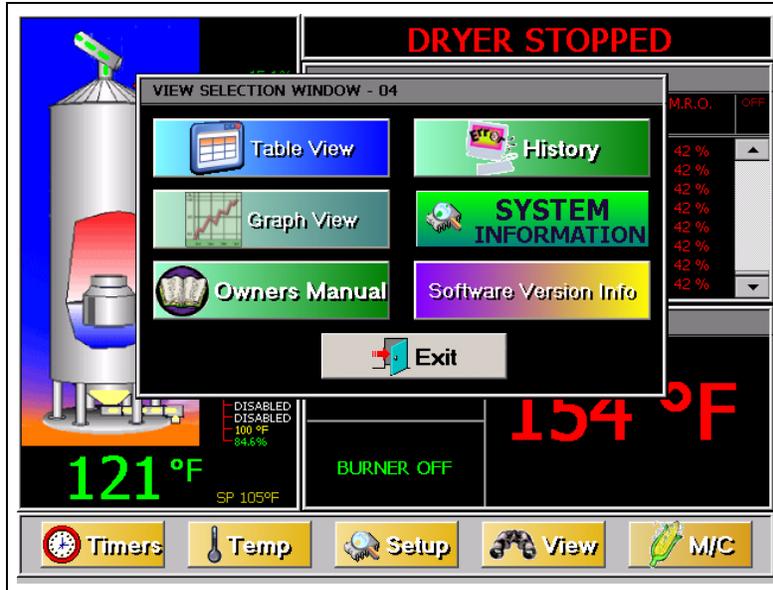

Figure 5R

1. **Table View:**  **Table View** This is the “Default Operation Screen”. (See Figure 5S.)

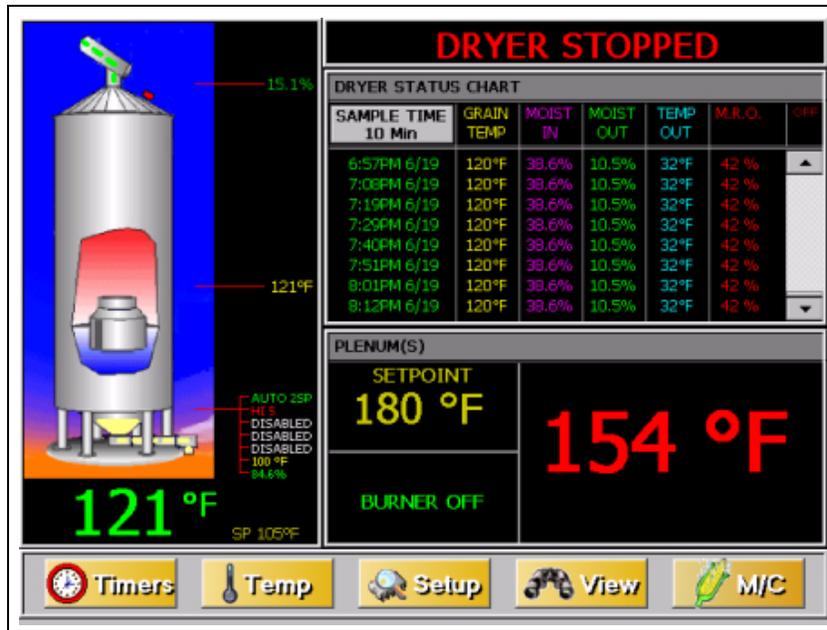

Figure 5S

## Select Data Log Sample Time

Notice the “Sample Time” button in the upper left hand side of the dryer status chart. By touching this button, the sample time can be changed from the default (1 minute) to 5, 10 or 15 minutes. Select the desired sample time and touch “Accept/Exit” to exit. Also, notice that the chart can be cleared by selecting the “Clear Table” button at the bottom. (See Figure 5T.)

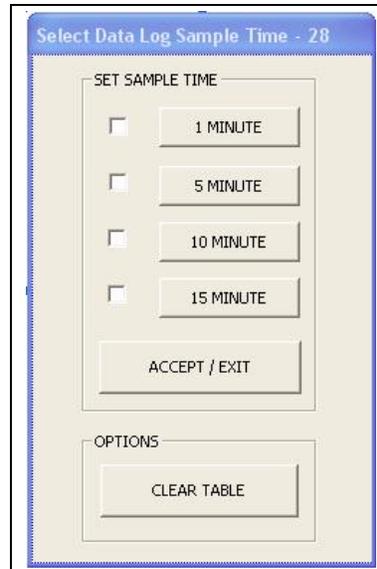

Figure 5T

2. **Graph View:**  This is the “Optional Operation Screen”. (See Figure 5U.)

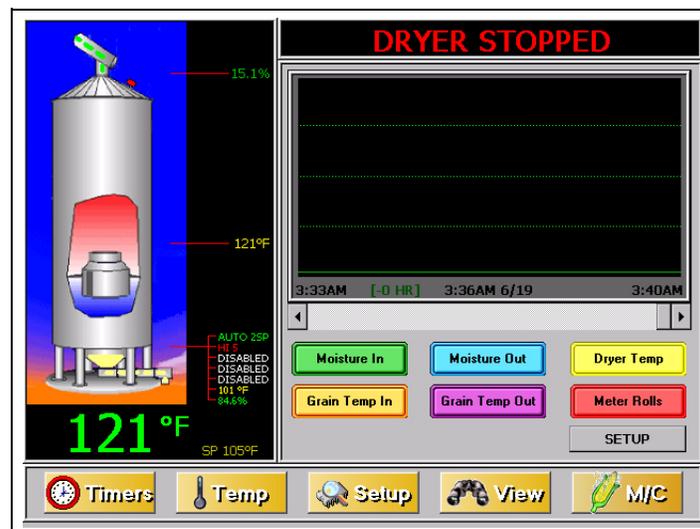

Figure 5U

To initiate this option, press the “Graph View” button, then touch the “Exit” button. Notice that the Dryer Status Chart and Plenum(s) sections have been replaced by the graph view. You can choose what the graph will display by touching any of the colored buttons under the graph (i.e. moisture in, moisture out, dryer temperature, grain temperature in, grain temperature out and meter rolls). Touching these buttons once will display them on the graph and touching them again will remove them. The “Setup” button will bring up the “Graph Setup” window and allow you to choose the length of time (1, 2, 4 or 8 hours) for the horizontal scale.

## 5. Operations

### 3. Owner's Manual: Owners Manual

This manual can be viewed on the Vision display screen. To view a manual, touch the “View” button. When the “View Selection Window” appears, choose the “Owner’s Manual” button. A new display will appear called an “Explorer Window”. The “Explorer Window” will show the manuals that are stored in the computer memory. To select a desired manual, “Double Tap” the corresponding manual icon, much like double clicking a mouse on the computer. Once selected, it may take a few seconds for the manual to be displayed. Once the manual is displayed, use the scroll bars on the right to scroll through the pages. To exit the manual and return to the Default Operation Screen, touch the “X” button in the upper right hand corner of the screen.

### 4. Error History: History shows the Dryer Shutdown History.

#### Viewing the Dryer Shutdown History

The dryer will keep track of all safety shutdown warnings. To view the “Shutdown History”, select the “View” button. When the “View Selection Window” appears, touch the “History” button. A new window called “Shutdown History” will appear. (See Figure 5V.) A list of all shutdown warnings are listed. This list can be sorted by:

- a. Warning
- b. Date/Time
- c. Node

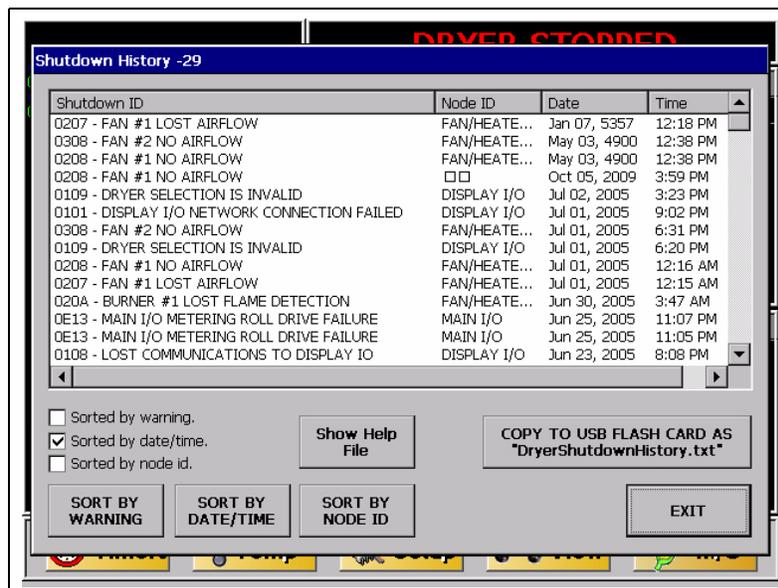

Figure 5V

The whole list can be copied to a USB flash drive and transferred to a personal computer as a text file by pressing the “Copy To USB Flash Card” button.

The list can also be cleared to start a new list by selecting the “Clear History” button.

To return to the “Default Operations Screen”, touch the “Exit” button.

### 5. System Information: Touching button will display the current software version the dryer is running and the time and date.

6. **Software Version Info:**  This option will list the major software changes and additions in relation to the last software release.

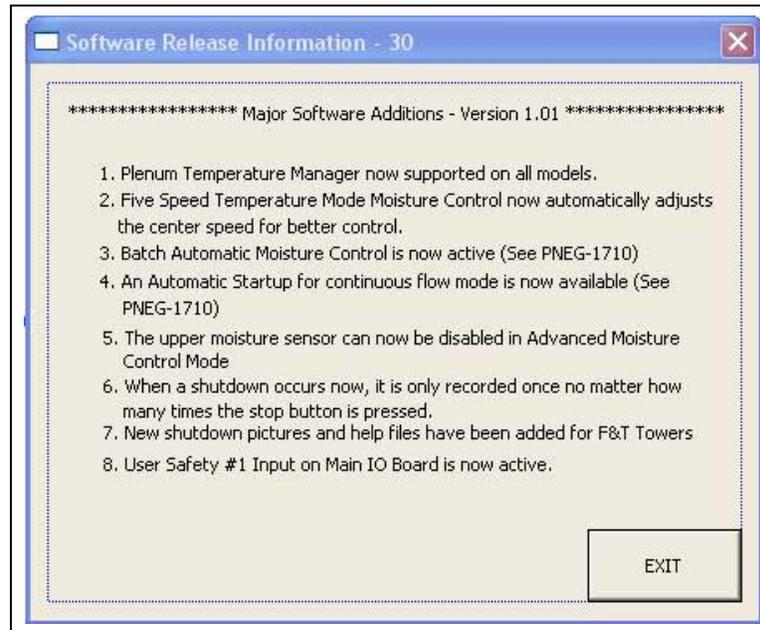

Figure 5W

## M/C Button

The  button is used to change setpoints for the moisture controls. Pressing the button will access one of the following two (2) screens, depending on the drying scheme selected.

## Modifying Temperature Setpoint

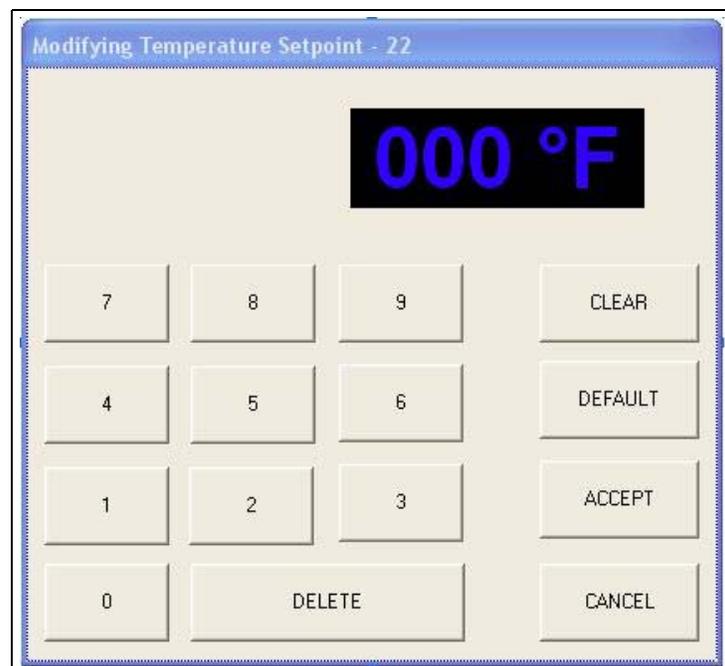

Figure 5X

### Modifying Moisture Setpoint

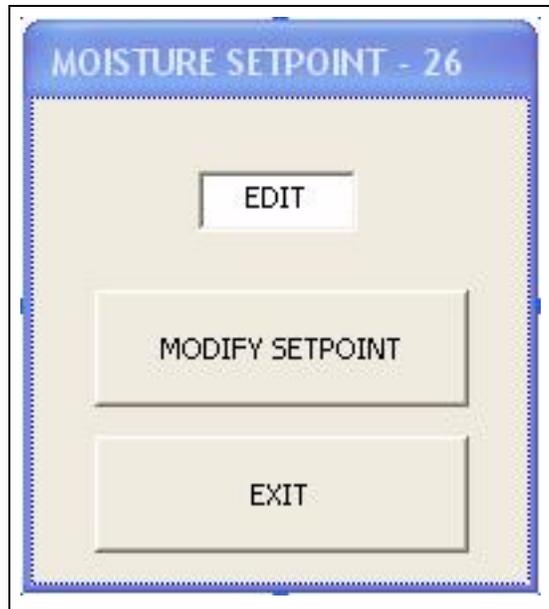

Figure 5Y

### Resetting Factory Defaults

If the Vision system starts malfunctioning, sometimes restoring the factory defaults will alleviate the problem.

**NOTE:** *This will completely change the system setup, so this procedure is encouraged to be performed by a service technician.*

1. Turn control power "OFF".
2. Locate the "DEF" dipswitch on the Display I/O board.
3. Push the switch to the left.
4. Turn control power "ON" and make sure the red light next to the "DEF" switch is lit.
5. At the "Boot Screen", press "Start Dryer".
6. Once a message appears instructing you to push the switch back to the left, the setting has been reset.
7. Turn control power "OFF".
8. Push the "DEF" dipswitch to the right.
9. The Vision system is now ready to operate normally.

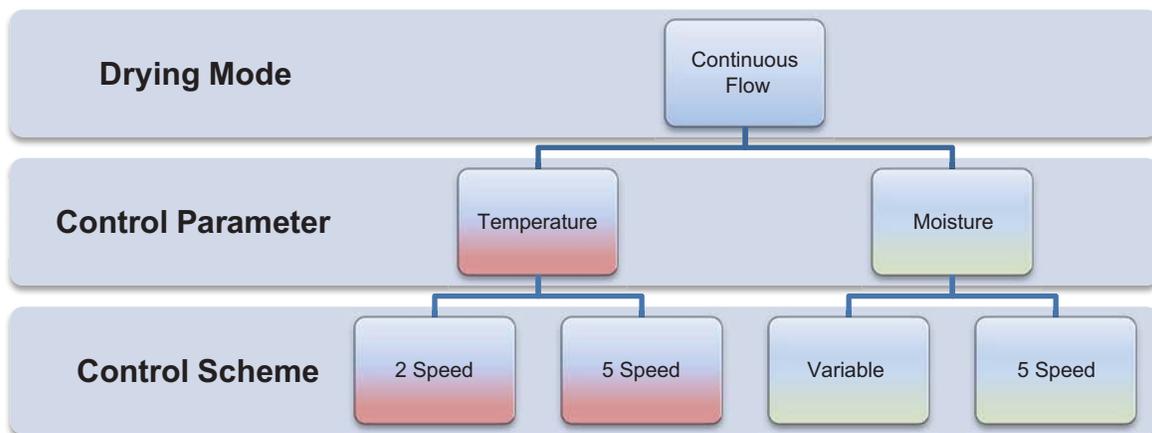

## Moisture Control Options

Moisture Control is used to regulate the moisture of the outgoing grain. For example, if a user is drying corn, the desired moisture content of the dried corn is usually around fifteen percent (15%). The moisture control schemes are designed to achieve that value with minimal effort from the user.

## Continuous Flow Drying

There are two (2) parameters the dryer can monitor to adjust Continuous Flow operation in an attempt to have consistent outgoing moisture: Temperature and Moisture. When we say “Adjust Continuous Flow Operation”, this means changing the unload rate of the dryer. By varying the unload rate, this changes the amount of time the grain stays in the drying chamber. This results in heating the grain more or less, depending on whether the unload rate is increased or decreased.

The following is a depiction of how the Continuous Flow modes break down.

## Temperature Controlled Schemes

The temperature controlled schemes use the grain temperature sensors as a reference parameter. As the grain temperature varies, the controls adjust the unload rate accordingly.

For example, we will assume a grain temperature setpoint of 105°. If the grain temperature sensor on the dryer is reporting 110°, the grain is 5° hotter than we would like it to be. To adjust the operation, the control scheme would realize the grain is getting too hot and increase the speed of the unload to lessen the amount of time the grain is exposed to the heating chamber. The opposite is true if the grain temperature sensor on the dryer reports lower than the setpoint. The unload rate would decrease. This means the grain temperature is directly proportional to the unload rate. If the grain temperature rises, the unload rate should increase.

The temperature controlled schemes have an exclusive option available for drying rice. This option is available in the two (2) temperature modes by switching the “COMP” dipswitch on the Display I/O board. The only change in the 2 Speed and 5 Speed temperature modes when drying rice is instead of monitoring the four (4) temperature sensors located at the 60% point of the column, it monitors the temperature sensor at the discharge. This allows the kernel temperature to stay at or below a set temperature with a kernel temp shutdown alarm during multiple pass drying common in rice. This is an exclusive GSI Group feature.

## 6. Moisture Control Options

---

### 2 Speed Temperature

#### When to Use:

For use when good management is available and a quick reacting time is desired in all heat or dry and cool operation.

#### How it Works:

The user should stabilize the dryer with the Unload switch in the “MANUAL” position. It is imperative that the dryer is outputting the desired moisture content grain before switching the unload to the “AUTO” position.

The user specifies two (2) desired meter roll speeds (Low and High) and a grain temperature setpoint for this scheme. If the grain temperature sensors on the dryer report a temperature 1° above the setpoint, the dryer will select the fastest unload rate (High). If the sensor reads 1° below the setpoint, the controller will run at the slower speed (Low).

There is also an “ON/OFF” option associated with the 2 Speed. The user only specifies one unload rate (ON) and the controller knows the other speed is zero (OFF). If the temperature sensor reads 1° above the setpoint, the metering rolls will run at the “ON” speed. The metering rolls are turned OFF if the temperature falls below the setpoint.

**NOTE:** A “Max Grain Temp” is available for this scheme. By enabling this feature, the dryer will shutdown and issue a warning if the grain temperature exceeds the “Max Grain Temp” value.

#### Setup Procedure

1. Press the “Stop” button on the control panel if the dryer is running.
2. From the “Setup” screen, select “Drying Mode”, then “Continuous Flow”.
3. From the “Drying Mode Selection” screen, select “M/C Setup” to access “Continuous Flow Setup”.
4. Select “Temperature” from the “Continuous Flow Control Schemes” group.
5. If desired, enable the “Max Grain Temp” safety.
6. Select “2 Speed” from the “Temp Based Options” group.
7. Press the “Accept” button and return to the “Default Operation Screen”.
8. Press the “Meter Roll Speed” adjustment knob to access the “Modifying Meter Roll Speed Setpoints” screen.
9. If the “ON/OFF” option is desired, verify the “ON/OFF” check box at the top right of the window is selected. If “ON/OFF” is not desired, make sure the “2 Speed” check box is selected.
10. Press the “Meter Roll Speed” adjustment knob until the “HIGH SP” bar is colored red. Adjust the “HIGH SP” by turning the knob until the desired setpoint is reached.
11. If “ON/OFF” is selected, skip to the next step. Depress the knob until the “LOW SP” bar is colored red. Turn the knob until the setpoint is attained.
12. Press “Accept/Exit”.
13. From the “Default Operation Screen”, press the “M/C” button and enter a grain temperature setpoint.
14. Turn the “Unload” switch to the “AUTO” position.
15. Press the “Start” button on the control panel.

## 5 Speed Temperature

### When to Use:

For use with a wider moisture variation spread and for when a close and quick reacting moisture control is desired in all heat or dry and cool operation.

### How it Works:

The user should stabilize the dryer with the Unload switch in the “MANUAL” position. It is imperative that the dryer is outputting the desired moisture content grain before switching the unload to the “AUTO” position.

There are five Speeds associated with this drying scheme, but the user only selects one unload rate. The meter roll setpoint is used as the middle or medium speed. The other four Speeds are offsets of the medium speed, two higher and two lower. These offsets are labeled as follows: **Low (LO)**, **Medium-Low (M-LO)**, **Medium (MED)**, **Medium-High (M-HI)** and **High (HI)**. The unload rate is determined by the difference between the grain temperature setpoint and the actual temperature sensor reading. If the reading is exactly that of our temperature setpoint (a zero offset), MED would be selected, because we are at the correct speed.

When setting up the 5 Speed Temperature scheme, there are two (2) sets of parameters: “Inner” and “Outer”. Both have a temperature and a meter roll speed associated with them. “Inner” refers to the M-LO and M-HI speeds, while “Outer” refers to LO and HI.

Let’s pretend we have the parameters set as they are presented in the following table.

	Inner (M-LO and M-HI)	Outer (LO and HI)
Temperature	1°	3°
Meter Speed Offset	3%	12%

We will set the meter roll setpoint to 50% and grain temperature setpoint to 100° for convenience. If the grain temperature actually is 100°, the MED unload would be selected (50% in our example). Should the grain temperature climb to 101°, the controller will change to M-HI, which increases the unload rate by 3%. Now the dryer’s unload is running at 53% (50% + 3% = 53%). If the grain temperature continues to climb, reaching 103°, HI will be selected which increases the unload rate by 12%. This 12% increase is in relation to the MED speed, NOT the M-HI, so the unload rate is now at 62% (50% + 12% = 62%). If the grain temperature falls back below 105°, the controller changes back to M-HI.

The same is true for grain temperatures below the setpoint, only the values are subtracted rather than added. If the grain temperature falls to 99°, the controller will select M-LO, changing the unload rate to 47% (50% - 3% = 47%).

The following table depicts how the controller would act when setup as the example above.

	LO (Outer)	M-LO (Inner)	MED	M-HI (Inner)	HI (Outer)
Grain Temperature	Less than or equal to 97°	Between 98° and 99°	At 100°	Between 101° and 102°	Greater than or equal to 103°
Unload Rate	38%	47%	50%	53%	62%

**NOTE:** *These are not necessarily the values that should be used with this scheme; these numbers were chosen strictly for explanation purposes.*

## 6. Moisture Control Options

This scheme also has a feature called “Auto-Centering”. If the controller is staying in HI the majority of the time, it probably means the metering roll setpoint (MED) is set too low. To alleviate this problem, the unload rate is continually averaged. Once an hour, the controller changes the metering roll setpoint (MED) to the averaged value. In the example above, if the controller stayed in HI for an entire hour, it would change the metering roll setpoint to 62% and would now act according to the table below.

	LO (Outer)	M-LO (Inner)	MED	M-HI (Inner)	HI (Outer)
Grain Temperature	Less than or equal to 97°	Between 98° and 99°	At 100°	Between 101° and 102°	Greater than or equal to 103°
Unload Rate	50%	59%	62%	65%	74%

**NOTE:** A “Max Grain Temp” safety is available for this scheme. By enabling this feature, the dryer will shutdown and issue a warning if the grain temperature exceeds the “Max Grain Temp” value.

### Setup procedure

1. Press the “Stop” button on the control panel if the dryer is running.
2. From the “Setup” screen, select “Drying Mode”, then “Continuous Flow”.
3. From the “Drying Mode Selection” screen, select “M/C Setup” to access “Continuous Flow Setup”.
4. Select “Temperature” from the “Continuous Flow Control Schemes” group.
5. If desired, enable the “Max Grain Temp” safety.
6. Select “5 Speed” from the “Temp Based Options” group.
7. If Auto-Centering is desired, select “Auto-Centering” from the “5 Speed Setup” group until the “Enabled” box is checked.
8. Select “5 Speed Setup” from the “5 Speed Setup” group.
9. Press the “Select” button until “Positive Inner Limit” is circled in red.
10. Use the “Inc” and “Dec” buttons on the left to adjust the “Temperature” offset for the “Inner” set.
11. Use the “Inc” and “Dec” buttons on the right to adjust the “Metering Speed” offset of the “Inner” set.
12. Press the “Select” button until the “Positive Outer Limit” is circled in red.
13. Use the “Inc” and “Dec” buttons on the left to adjust the “Temperature” offset for the “Outer” set.
14. Use the “Inc” and “Dec” buttons on the right to adjust the “Metering Speed” offset of the “Outer” set.
15. Return to the “Default Operation Screen”.
16. Press the “Meter Roll Speed” adjustment knob to access the “Modifying Meter Roll Speed Setpoints” screen.
17. Adjust the meter roll speed to the desired setpoint and press “Accept/Exit”.
18. Return to the “Default Operation Screen”.
19. Press the “M/C” button and enter a grain temperature setpoint.
20. Turn the “Unload” switch to the “AUTO” position.
21. Press the “Start” button on the control panel.

## Moisture Controlled Schemes

The moisture controlled schemes use the exiting moisture sensor as a reference parameter. As the grain moisture content varies, the controls adjust the unload rate accordingly.

For example, our outgoing (dry) moisture setpoint will be set at 15%. If the outgoing moisture sensor reports a reading of 16%, the grain is 1% wetter than we desire. To account for this, we decrease the unload rate, therefore increasing the amount of time the grain is in the heating chamber. The relationship between moisture and unload rate is inversely proportional. As the exiting moisture increases, the unload rate should decrease.

### 5 Speed Moisture

#### When to Use:

For use with a wider moisture variation spread and for when a moderate reacting moisture control is desired in all heat operation. **Not recommended for dry and cool operation.**

#### How it Works:

The user should stabilize the dryer with the Unload switch in the “MANUAL” position. It is imperative that the dryer is outputting the desired moisture content grain before switching the unload to the “AUTO” position.

There are five Speeds associated with this drying scheme, but the user only selects one unload rate. The meter roll setpoint is used as the middle or medium speed. The other four Speeds are offsets of the medium speed, two higher and two lower. These offsets are labeled as follows: **Low (LO), Medium-Low (M-LO), Medium (MED), Medium-High (M-HI) and High (HI)**. The unload rate is determined by the difference between the moisture setpoint and the actual moisture sensor reading. If the reading is exactly that of our moisture setpoint (a zero offset), MED would be selected, because we must be at the correct speed.

When setting up the 5 Speed Moisture scheme, there are two (2) sets of parameters: “Inner” and “Outer”. Both have a moisture and meter roll speed associated with them. “Inner” refers to the M-LO and M-HI speeds, while “Outer” refers to LO and HI.

Let’s pretend we have the parameters set as they are presented in the following table.

	Inner (M-LO and M-HI)	Outer (LO and HI)
Moisture	0.2%	0.5%
Meter Speed Offset	3%	12%

We will set the meter roll setpoint to 50% and the dry grain moisture setpoint to 15% for convenience. If the dry grain moisture is actually 15%, the MED unload would be selected (50% in our example). Should the dry grain moisture climb to 15.2%, the controller would change to M-HI, which increases the unload rate by 3%. Now the dryer’s unload is running at 53% ( $50\% + 3\% = 53\%$ ). If the dry grain moisture continues to climb, reaching 15.5%, HI will be selected which increases the unload rate by 12%. This 12% increase is in relation to the MED speed, NOT the M-HI, so the unload rate is now at 62% ( $50\% + 12\% = 62\%$ ). If the dry grain moisture falls back below 15.5%, the controller changes back to M-LO.

The same is true for dry grain moistures below the setpoint, only the values are subtracted rather than added. If the dry grain moisture falls to 14.8%, the controller will select M-LO, changing the unload rate to 47% ( $50\% - 3\% = 47\%$ ).

The following table depicts how the controller would act when setup as the example above.

	LO (Outer)	M-LO (Inner)	MED	M-HI (Inner)	HI (Outer)
Grain Temperature	Less than or equal to 14.5%	Between 14.6% and 14.8%	Between 14.9% and 15.1%	Between 15.2% and 15.4%	Greater than or equal to 15.5%
Unload Rate	38%	47%	50%	53%	62%

**NOTE:** *These are not necessarily the values that should be used with this scheme; these numbers were chosen strictly for explanation purposes.*

## 6. Moisture Control Options

This scheme also has a feature called “Auto-Centering”. If the controller is staying in HI the majority of the time, it probably means the metering roll setpoint (MED) is set too low. To alleviate this problem, the unload rate is continually averaged. Once an hour, the controller changes the metering roll setpoint (MED) to the whatever the averaged value. So in the example above, if the controller stayed in HI for an entire hour, it would change the metering roll setpoint to 70% and would now act according to the table below.

	LO (Outer)	M-LO (Inner)	MED	M-HI (Inner)	HI (Outer)
Grain Temperature	Less than or equal to 14.5%	Between 14.6% and 14.8%	Between 14.9% and 15.1%	Between 15.2% and 15.4%	Greater than or equal to 15.5%
Unload Rate	50%	59%	62%	65%	74%

**NOTE:** A “Max Grain Temp” safety is available for this scheme. By enabling this feature, the dryer will shutdown and issue a warning if the grain temperature exceeds the “Max Grain Temp” value.

### Setup Procedure

1. Press the “Stop” button on the control panel if the dryer is running.
2. From the “Setup” screen, select “Drying Mode”, then “Continuous Flow”.
3. From the “Drying Mode Selection” screen, select “M/C Setup” to access “Continuous Flow Setup”.
4. Select “Moisture” from the “Continuous Flow Control Schemes” group.
5. If desired, enable the “Max Grain Temp” safety.
6. Select “5 Speed” from the “Moisture Based Options” group.
7. If Auto-Centering is desired, select “Auto-Centering” from the “5 Speed Setup” group until the “Enabled” box is checked.
8. Select “5 Speed Setup” from the “5 Speed Setup” group.
9. Press the “Select” button until “Positive Inner Limit” is circled in red.
10. Use the “Inc” and “Dec” buttons on the left to adjust the “Moisture” offset for the “Inner” set.
11. Use the “Inc” and “Dec” buttons on the right to adjust the “Metering Speed” offset of the “Inner” set.
12. Press the “Select” button until the “Positive Outer Limit” is circled in red.
13. Use the “Inc” and “Dec” buttons on the left to adjust the “Moisture” offset for the “Outer” set.
14. Use the “Inc” and “Dec” buttons on the right to adjust the “Metering Speed” offset of the “Outer” set.
15. Return to the “Default Operation Screen”.
16. Press the “Meter Roll Speed” adjustment knob to access the “Modifying Meter Roll Speed Setpoints” screen.
17. Adjust the meter roll speed to the desired setpoint and press “Accept/Exit”.
18. Return to the “Default Operation Screen”.
19. Press the “M/C” button and enter a dry grain moisture setpoint.
20. Turn the “Unload” switch to the “AUTO” position.
21. Press the “Start” button on the control panel.

### Variable Moisture

#### When to Use:

For use when minimum moisture management is available and when large, quick changes in moisture are not expected. Can be used during all heat and dry and cool operation.

#### How it Works:

The user should stabilize the dryer with the Unload switch in the “MANUAL” position. It is imperative that the dryer is outputting the desired moisture content grain before switching the unload to the “AUTO” position. Within one minute of switching the unload to “AUTO”, the dryer uses the current state of the sensors as a reference for future adjustments. The dryer will then run through a 30 minutes learning period and controller adjustments will begin after.

The controller continuously monitors the moisture coming in and out of the dryer and the column grain temperature 2/3 of the way down the dryer. The control action is mainly based on the dry moisture sensor at the outlet of the dryer. If the moisture coming out of the dryer is not right at the target, the controller will speed up or slow down the unload rate accordingly. The wet moisture sensor and the grain temperature sensor are intended to detect moisture spikes coming into the dryer so that the moisture controller can react ahead of time. For example, if the wet sensor detects a jump of moisture coming into the dryer, the controller will start slowing down the unload speed immediately. However, the controller does not act to the full scale right away. Instead, it slows down the dryer gradually so that the grain currently in the dryer will not be over-dried.

**NOTE:** *The wet moisture sensor can be disabled in this scheme. The wet moisture reading reported will be ignored by the calculations.*

**NOTE:** *A “Max Grain Temp” safety is available for this scheme. By enabling this feature, the dryer will shutdown and issue a warning if the grain temperature exceeds the “Max Grain Temp” value.*

#### Setup Procedure

1. Press the “Stop” button on the control panel if the dryer is running.
2. From the “Setup” screen, select “Drying Mode”, then “Continuous Flow”.
3. From the “Drying Mode Selection” screen, select “M/C Setup” to access “Continuous Flow Setup”.
4. Select “Moisture” from the “Continuous Flow Control Schemes” group.
5. If desired, enable the “Max Grain Temp” safety.
6. Select “Variable” from the “Moisture Based Options” group.
7. If desired, enable/disable the “Upper Moisture Sensor”.
8. Return to the “Default Operation Screen”.
9. Turn the “Unload” switch to the “MANUAL” position.
10. Press the “Start” button on the control panel.
11. Press the “Meter Roll Speed” adjustment knob to access the “Modifying Meter Roll Speed Setpoints” screen.
12. Adjust to desired speed and press “Accept/Exit”.
13. Wait at least 30 minutes, depending on the size of the dryer and check for consistent dry moisture. If moisture is not consistent, repeat [Steps 11 and 12](#).
14. If you have made it here, the grain must be exiting consistently. If not, return to [Step 11](#).
15. Turn the “Unload” switch to the “AUTO” position.

## 7. Initial Settings Check

---

### Dealer Suggested Initial Settings Check

1. Power on using the Control Power switch. Wait approximately 30 seconds.
2. Now viewing the “Boot Screen”, select “Start Dryer”.
3. Setup timers.
4. Using the “Extended Setup Screen”, select the following options to configure the dryer. Please use [Operations Chapter on Page 19](#) as a reference guide.
  - a. “Dryer Model” and check and verify the following parameters:
    - Number of Fans
    - Fuel
    - Model Number
  - b. Set date and time settings.
  - c. Set temp scale settings.
  - d. Set data logger settings.
5. Using the “Setup Screen”, select the following options to configure the dryer. Please use [Operations Chapter on Page 19](#) as a reference guide.
  - a. Set unload parameters settings.
  - b. Check burner mode settings.
  - c. Moisture control setup. (Refer to [Moisture Control Options Chapter on Page 35](#) for detailed operation descriptions.)

### Owner Suggested Initial Settings Check

1. Power on using the Control Power switch. Wait approximately 30 seconds.
2. Now viewing the “Boot Screen”, select “Start Dryer”.
3. Using the “Setup Screen”, select the following options to configure the dryer. Please use [Operations Chapter on Page 19](#) as a reference guide.
  - a. Set drying mode settings.
  - b. Select moisture control setup. (Refer to [Moisture Control Options Chapter on Page 35](#) for detailed operation descriptions.)
4. Set switches appropriately on the control panel.
5. Select the “Start” button on the control panel.

In the event of a dryer malfunction, the following error screen will appear:

Figure 8A

After you press the “Help” button, the “Shutdown Help File”, shown in [Figure 8A](#), is displayed. It will display a picture of the part that may have caused the shutdown, along with a reason for the error.

### Fan/Heater Shutdown Messages

“X” represents a number between 1 and 6 in the following message names. Fan/Heater #1 is closest to the ground and the numbers increase as you move upwards.

#### 0201 - Fan #X Motor Overload

This message indicates that the thermal overloads on either the fan, load, unload or auxiliary motors have opened, indicating an over current condition. The overloads must be manually reset. The message will identify which fan overload caused the shutdown.

#### 0202 - Burner #X Housing Temp High-Limit

This error indicates that the temperature high-limit locate on the fan/burner housing opened, indicating an over temperature condition occurred towards the rear of the fan/heater housing. This control is set at 210°F (99°C) and automatically resets itself when cooled. This can be caused by a grain column plugged with trash or the meter rolls may be adjusted to run too slowly. Feel the grain columns to determine which one may be causing the problems. If all the columns are hot to the touch, check the meter roll settings. If all columns are not hot, examine the column that feels the hottest. Make sure you can see the grain moving down the column screens.

## 8. Safety Circuit Shutdown Messages

---

### **0203 - Burner #X Vapor Temp High-Limit**

This message indicates that the LP gas vapor temperature sensor located in the gas pipe train downstream from the vaporizer has opened, indicating that the vaporizer is running too hot and must be readjusted. This sensor is set at 200°F (93°C) and automatically resets itself when cooled. The message will identify which burner caused the shutdown. Try adjusting the vaporizer coils farther away from the burner's flame. You may also want to try switching the burner mode from High/Low to ON/OFF, especially on warmer days.

### **0204 - Burner #X Plenum Overheat**

This message indicates that an over-temperature condition occurred inside the dryer plenum. This control is a 300°F (149°C) limit and automatically resets itself when cooled. The message will identify which plenum caused the shutdown.

### **0205 - Burner #X Grain Overheat**

A grain high-limit sensor runs through the center of the columns of each module. The safety is tied to the lowest fan/heater on that module. If the sensor reaches 210°F, it will open, shutting down the dryer. There could possibly be a plugged column.

### **0206 - Burner #X Gas Pressure High-Limit**

A gas over-pressure switch is placed on the high side of the gas regulator. If the gas pressure exceeds a certain value, the dryer will shutdown. This is not standard on all dryers.

### **0207 - Burner #X Lost Airflow**

This error message is displayed when airflow (air pressure) has been established but was subsequently lost. This could happen if, during the dryer's operation, the grain settled or if grain shrinkage occurred in the grain columns, thereby causing a loss of air pressure in the plenum chamber.

### **0208 - Burner #X No Airflow**

Contacts in the air switch failed to open due to the fan not turning or the air switch may need adjustment. The message will identify which fan caused the shutdown.

### **0209 - Burner #X Ignition Failure**

This condition occurs during the initial ignition of the burner. If the burner fails to light, check to make sure that the gas has been turned ON and/or the Maxon valve has been turned ON.

### **020A - Burner #X Lost Flame Detection**

The flame sensor failed to detect a burner flame which had been established but was lost subsequently and there is a problem with the flame sensing circuitry or the dryer is not getting burner fuel. The message will identify which burner caused the shutdown.

### **020B - Burner #X Plenum Overheat (Thermistor)**

This message indicates that an over-temperature condition occurred inside the dryer plenum. This control is a 300°F (149°C) limit and automatically resets itself when cooled. The message will identify which plenum caused the shutdown.

### **020C - Burner #X Grain Overheat (Thermistor)**

This error indicates that an over-temperature condition has occurred in one of the grain columns causing the control to shutdown the dryer. This control is set at 210°F (99°C) and automatically resets itself when cooled. This can be caused by a grain column plugged with trash or the meter rolls may be adjusted to run too slowly. Feel the grain columns to determine which one may be causing the malfunction. If all the columns are hot to the touch, check the meter roll settings. If all columns are not hot, examine the column that feels the hottest. Make sure you can see the grain moving down the column screens.

### **020D - Plenum #X Temperature Sensor Shorted**

This error indicates there is a shorted condition with one of the grain temperature sensors located inside the left or right grain columns. This could be a shorted sensor or the sensor wires could be shorted.

### **020E - Plenum #X Temperature Sensor Open**

This error indicates there is an open condition with the plenum temperature sensor located inside the plenum chamber. This could be an open sensor or the sensor wires could have an open connection.

### **020F - Grain #X Temperature Sensor Shorted**

This error indicates there is a shorted condition with one of the grain temperature sensors located inside the left or right grain columns. This could be a shorted sensor or the sensor wires could be shorted.

### **0210 - Grain #X Temperature Sensor Open**

This error indicates there is an open condition with the grain temperature sensor located inside the plenum chamber. This could be an open sensor or the sensor wires could have an open connection.

### **0211 - Fan #X Contactor did not Close**

The auxiliary contactor on the fan contactor did not close when the fans were supposed to be started. Could possibly be a bad contactor or some wiring is loose.

### **0212 - Fan #X had Airflow Before Fan Power**

The air switch contacts have closed prior to the fan starting, indicating a freewheeling blade or improper setting of the air switch. The message will identify which fan caused the shutdown. This indicates that 12 VDC has been lost to terminal J4-04 on the fan/heater board.

### **0213 - Fan #X Network Connection Failed**

This error is generated whenever the fan/heater board has lost its communications link with the Input/Output board (upper control panel) and the master display board (lower control panel). Check the Ethernet cable jacks to make sure they are plugged in tightly.

### **0214 - Gas Pressure Low-Limit**

Between the regulator and solenoids on the pipe train, there is a low limit pressure switch. This safety is connected to the J4-02 terminal on Fan/Heater board. Loss of gas supply or improper limit adjustment could cause this warning.

## 8. Safety Circuit Shutdown Messages

---

### Main I/O Shutdown Messages

#### **0E01 - Main I/O - Primary Unload Motor Overload**

This message indicates that the unload motor overload has been tripped in the upper control box. This indicates that 12 VDC has been lost to terminal J1-02 on the Input/Output board. Push the red button on the overload to reset this error. This is caused by the motor operating under too much load, which uses more current (amperage). If the problem continues, then check the motor to make sure it is not being overworked. You may need to call an electrician to measure the motor's full load amps (FLA).

#### **0E02 - Main I/O - Primary Load Motor Overload**

This message indicates that the motor overload has tripped on the load motor overload located in the upper control box. This can occur if the safety 12 VDC to terminal J1-03 on the Input/Output board is loose. Push the red button on the overload to reset this error. This is caused by the motor operating under too much load, which uses more current (amperage). If the problem continues, then check the motor to make sure it is not being overworked. You may need to call an electrician to measure the motor's full load amps (FLA).

#### **0E03 - Main I/O - Auxiliary Unload Motor Overload**

This message indicates that the motor overload relay has been tripped on the auxiliary unload motor circuit located in the upper control box. This can occur if safety 12 VDC to terminal J1-04 on the Input/Output board is loose. Push the red button on the overload to reset this error. This is caused by the motor operating under too much load, which uses more current (amperage). If the problem reoccurs, then check the motor to make sure it is not being overworked. You may need to call an electrician to measure the motor's full load amps (FLA).

#### **0E04 - Main I/O - Auxiliary Load Motor Overload**

This message indicates that the motor overload relay has tripped on the auxiliary load motor circuit located in the upper control box. This can occur if safety 12 VDC to terminal J1-05 on the Input/Output board is loose. Push the red button on the overload to reset this error. This is caused by the motor operating under too much load, which uses more current (amperage). If the problem reoccurs, then check the motor to make sure it is not being overworked. You may need to call an electrician to measure the motor's full load amps (FLA).

#### **0E05 - Main I/O - Rear Discharge Door Open**

This message indicates that the lid on the grain discharge box has opened, indicating that either the grain is not being taken away fast enough or the take away auger system connected to the dryer may be causing the problem. This can also occur if this safety loses 12 VDC to terminal J1-08 on the Input/Output board.

#### **0E06 - Main I/O - Air System Failure**

This message indicates that a shutdown has occurred due to an air system that was installed with an integral safety switch that was in the unit. The air system safety connections are located in the upper control box on the terminal strip. This can occur if safety 12 VDC to terminal J1-10 on the Input/Output board is loose. This input is on the terminal strip when it leaves the factory and is usually installed in the field by a qualified electrician.

### **0E08 - Main I/O - Out of Grain Timer (OOG) Expired**

This message indicates that the dryer has run low on grain and the out of grain timer has timed out, shutting the dryer down. The unload auger will continue to run so it can clean out the remaining grain before shutting down.

### **0E09 - Main I/O - Network Connection Failed**

This error is generated whenever the master display board (lower control panel) has lost its communications link with the Input/Output board (upper control panel door) and the fan/heater boards. Check the Ethernet cable jacks to make sure they are plugged in tightly.

### **0E13 - Main I/O - Metering Roll Drive Failure**

This message indicates that the meter rolls are not turning, possibly due to the meter roll speed adjustment being set too low. It also could indicate that there is a defective meter roll sensor, the metering roll drive system has failed to turn, or there is a broken chain or a component has jammed the metering roll. This message can occur if the input is not receiving a 5 volt pulse on terminal J4-04 on the Input/Output board.

### **0E15 - Main I/O - Valve Proving System Failure**

In CE regulations, a Dung's valve proving system is required. It is attached to the low side of the regulator. If there is a leak present, the contacts will open causing the shutdown of the dryer.

### **0E16 - Main I/O - J2-04 - User Safety 2 Open**

If a user would like to add a safety device to the Vision system, a normally closed contactor/relay can be attached to this input and the dryer will shutdown if it opens. This is normally jumped out if not in use.

### **0E17 - Main I/O - J2-05 - User Safety 3 Open**

If a user would like to add a safety device to the Vision system, a normally closed contactor/relay can be attached to this input and the dryer will shutdown if it opens. This is normally jumped out if not in use.

### **0E18 - Main I/O - J2-02 - Metering Motor Overload**

If an overload device is monitoring the meter system, this input is used to shutdown the dryer if there is a problem. Possibly a plugged meter system would trip this safety.

### **0E19 - Main I/O - J2-06 - User Safety 4 Open**

If a user would like to add a safety device to the Vision system, a normally closed contactor/relay can be attached to this input and the dryer will shutdown if it opens. This is normally jumped out if not in use.

### Moisture Control Shutdown Messages

#### **0F01 - MC - Network Connection Failed**

This error is generated whenever the master display board (lower control panel) has lost its communications link with the moisture board (lower control panel or separate enclosure). Check the Ethernet cable jacks to make sure they are plugged in tightly.

#### **0F02 - Max Drying Time Exceeded**

This safety can be used when drying in stage batch mode. See [Moisture Control Options Chapter on Page 35](#) for a detailed explanation.

#### **0F03 - Max Grain Temperature Exceeded**

This safety can be used when drying in continuous flow or stage batch mode. See [Moisture Control Options Chapter on Page 35](#) for a detailed explanation.

## GSI Group, LLC Limited Warranty

The GSI Group, LLC ("GSI") warrants products which it manufactures to be free of defects in materials and workmanship under normal usage and conditions for a period of 12 months after sale to the original end-user or if a foreign sale, 14 months from arrival at port of discharge, whichever is earlier. The end-user's sole remedy (and GSI's only obligation) is to repair or replace, at GSI's option and expense, products that in GSI's judgment, contain a material defect in materials or workmanship. Expenses incurred by or on behalf of the end-user without prior written authorization from the GSI Warranty Group shall be the sole responsibility of the end-user.

### Warranty Extensions:

The Limited Warranty period is extended for the following products:

	Product	Warranty Period	
<b>AP Fans and Flooring</b>	Performer Series Direct Drive Fan Motor	3 Years	* Warranty prorated from list price: 0 to 3 years - no cost to end-user 3 to 5 years - end-user pays 25% 5 to 7 years - end-user pays 50% 7 to 10 years - end-user pays 75%
	All Fiberglass Housings	Lifetime	
	All Fiberglass Propellers	Lifetime	
<b>Cumberland Feeding/Watering Systems</b>	Feeder System Pan Assemblies	5 Years **	** Warranty prorated from list price: 0 to 3 years - no cost to end-user 3 to 5 years - end-user pays 50%
	Feed Tubes (1-3/4" and 2.00")	10 Years *	
	Centerless Augers	10 Years *	
	Watering Nipples	10 Years *	
<b>Grain Systems</b>	Grain Bin Structural Design	5 Years	
<b>Grain Systems Farm Fans Zimmerman</b>	Portable and Tower Dryers	2 Years	† Motors, burner components and moving parts not included. Portable dryer screens included. Tower dryer screens not included.
	Portable and Tower Dryer Frames and Internal Infrastructure †	5 Years	

GSI further warrants that the portable and tower dryer frame and basket, excluding all auger and auger drive components, shall be free from defects in materials for a period of time beginning on the twelfth (12<sup>th</sup>) month from the date of purchase and continuing until the sixtieth (60<sup>th</sup>) month from the date of purchase (extended warranty period). During the extended warranty period, GSI will replace the frame or basket components that prove to be defective under normal conditions of use without charge, excluding the labor, transportation, and/or shipping costs incurred in the performance of this extended warranty.

### Conditions and Limitations:

THERE ARE NO WARRANTIES THAT EXTEND BEYOND THE LIMITED WARRANTY DESCRIPTION SET FORTH ABOVE. SPECIFICALLY, GSI MAKES NO FURTHER WARRANTY OF ANY KIND, EXPRESS OR IMPLIED, INCLUDING, WITHOUT LIMITATION, WARRANTIES OF MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE OR USE IN CONNECTION WITH: (I) PRODUCT MANUFACTURED OR SOLD BY GSI OR (II) ANY ADVICE, INSTRUCTION, RECOMMENDATION OR SUGGESTION PROVIDED BY AN AGENT, REPRESENTATIVE OR EMPLOYEE OF GSI REGARDING OR RELATED TO THE CONFIGURATION, INSTALLATION, LAYOUT, SUITABILITY FOR A PARTICULAR PURPOSE, OR DESIGN OF SUCH PRODUCTS.

GSI shall not be liable for any direct, indirect, incidental or consequential damages, including, without limitation, loss of anticipated profits or benefits. The sole and exclusive remedy is set forth in the Limited Warranty, which shall not exceed the amount paid for the product purchased. This warranty is not transferable and applies only to the original end-user. GSI shall have no obligation or responsibility for any representations or warranties made by or on behalf of any dealer, agent or distributor.

GSI assumes no responsibility for claims resulting from construction defects or unauthorized modifications to products which it manufactured. Modifications to products not specifically delineated in the manual accompanying the equipment at initial sale will void the Limited Warranty.

This Limited Warranty shall not extend to products or parts which have been damaged by negligent use, misuse, alteration, accident or which have been improperly/inadequately maintained. This Limited Warranty extends solely to products manufactured by GSI.

Prior to installation, the end-user has the responsibility to comply with federal, state and local codes which apply to the location and installation of products manufactured or sold by GSI.

This equipment shall be installed in accordance with the current installation codes and applicable regulations which should be carefully followed in all cases. Authorities having jurisdiction should be consulted before installations are made.
